

1. Fig. 15 shows a uniform shelf AB of weight W N. The shelf is 180 cm long and rests on supports at points C and D. Point C is 30 cm from A and point D is 60 cm from B.

Fig. 15

Determine the range of positions a point load of $3W$ could be placed on the shelf without the shelf tipping.

[6]

2. A non-uniform rod 0.8 m long rests horizontally on smooth pegs A and B at each end of the rod. The contact forces at A and B are 10 N and 15 N respectively, as shown in Fig. 2.

Fig. 2

Calculate the distance of the centre of mass of the rod from A.

[3]

3. A rod of length 2 m hangs vertically in equilibrium. Parallel horizontal forces of 30 N and 50 N are applied to the top and bottom and the rod is held in place by a horizontal force F N applied x m below the top of the rod as shown in Fig. 7.

Fig. 7

(a) Find the value of F .

[1]

(b) Find the value of x .

[2]

4. Fig. 7 shows a rectangular lamina ABCD with sides AB of length 60 cm and AD of length 50 cm. The lamina is lying flat on a smooth horizontal surface, and is acted on by the following five horizontal forces.
- 45 N at A in the direction BA
 - 40 N at D in the direction AD
 - 27 N at C in the direction BC
 - Y N at A in the direction DA
 - X N at E in a direction perpendicular to the edge BC

The lamina is in equilibrium. The distance BE is d cm.

Fig. 7

Calculate the values of each of the following.

- X
- Y
- d

[4]

5. Fig. 3 shows a rod AB which is 0.9 m long and hangs vertically from a smooth hinge at A. The rod can rotate about A in a vertical plane. Forces of 100 N and 60 N act at right angles to AB in this plane. Their points of application are 0.3 m and 0.75 m respectively below A.

Fig. 3

- (a) Find the combined moment of these forces about A. [2]

The rod is held in equilibrium by a force of F N which is also at right angles to the rod in the same vertical plane.

- (b) Find the least possible value of F . [2]

- (c) Explain how the rod can be in equilibrium when the resultant of these three forces is not zero. [2]
