# AS Level Mathematics B (MEI)

**H630/01** Pure Mathematics and Mechanics

Time allowed: 1 hour 30 minutes

# You must have:

- the Printed Answer Booklet
- · a scientific or graphical calculator

#### **INSTRUCTIONS**

- Use black ink. You can use an HB pencil, but only for graphs and diagrams.
- Write your answer to each question in the space provided in the Printed Answer
  Booklet. If you need extra space use the lined pages at the end of the Printed Answer
  Booklet. The question numbers must be clearly shown.
- Fill in the boxes on the front of the Printed Answer Booklet.
- Answer all the guestions.
- Where appropriate, your answer should be supported with working. Marks might be given for using a correct method, even if your answer is wrong.
- Give your final answers to a degree of accuracy that is appropriate to the context.
- The acceleration due to gravity is denoted by g m s<sup>-2</sup>. When a numerical value is needed use g = 9.8 unless a different value is specified in the question.
- Do not send this Question Paper for marking. Keep it in the centre or recycle it.

#### **INFORMATION**

- The total mark for this paper is 70.
- The marks for each question are shown in brackets [ ].
- This document has 8 pages.

#### **ADVICE**

Read each question carefully before you start your answer.

(a) Show that the triangle PQR is isosceles.

[3]

The point P has position vector  $-3\mathbf{i} - \mathbf{j}$ . The point S is added so that PQRS is a parallelogram.

**(b)** Find the position vector of S.

[2]

a) 
$$\overrightarrow{PQ} = (+7)$$
  
 $\overrightarrow{QR} = 4i - 12j$   
 $\therefore \overrightarrow{PP} = \overrightarrow{PQ} + \overrightarrow{QP}$

- A car travelling in a straight line accelerates uniformly from rest to  $V \,\mathrm{ms}^{-1}$  in  $T \mathrm{s}$ . It then slows 9 down uniformly, coming to rest after a further 2Ts.
  - (a) Sketch a velocity-time graph for the car.

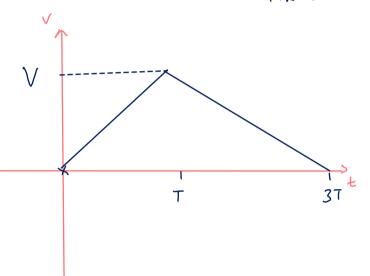

[2]

The acceleration in the first stage of the motion is 2.5 ms<sup>-2</sup> and the total distance travelled is 240 m.

**(b)** Calculate the values of V and T.

T+11=3T [4]

Officeleration = gradient of the graph

$$\frac{V}{T} = 2.57$$
  $V = 2.57$ 

(2) Distance travelled = Area under the graph

10 An astronaut on the surface of the moon drops a ball from a point 2 m above the surface.

(a) Without any calculations, explain why a standard model using  $g = 9.8 \,\mathrm{ms}^{-2}$  will not be appropriate to model the fall of the ball.

The ball takes 1.6 s to hit the surface.

- (b) Find the acceleration of the ball which best models its motion. Give your answer correct to 2 significant figures. [2]
- (c) Use this value to predict the maximum height of the ball above the point of projection when thrown vertically upwards with an initial velocity of 15 ms<sup>-1</sup>. [2]

a) Because acceleration due to gravity is only 9-8ms<sup>2</sup> on earth, and the value changes depending where you are in the universe.

(c) Show that the equation  $2\log_2(x+8) - \log_2(x+6) = 3$  has only one root. [5]

a) - The argument is incorrect.

- The statement  $x \ge 16$  includes negative values for x for which  $x^{1/2} \ge 4$  doesn't exist : the stament doesn't imply

#### 12 In this question you must show detailed reasoning.

Fig. 12 shows part of the graph of  $y = x^2 + \frac{1}{x^2}$ .

$$1/x^2 = x^{-2}$$

[6]

Fig. 12

The tangent to the curve  $y = x^2 + \frac{1}{x^2}$  at the point  $(2, \frac{17}{4})$  meets the x-axis at A and meets the y-axis

- (a) Find the exact area of the triangle OAB.
- (b) Use calculus to prove that the complete curve has two minimum points and no maximum point. [6]

 $y = 2x + (-2)x^{-3}$   $x = 2x - 2x^{-3}$ 

$$\frac{dy}{dz} = 2(2) - 2(2)^{-3}$$

$$\frac{dz}{4} = \frac{15}{4}$$

$$y = mx + C$$
with  $m = \frac{15}{4}$ 
 $(= (2, 17/4)$ 

$$y = \frac{15}{4}x + c$$

$$(=\frac{17}{4}-\frac{15}{2}=-\frac{13}{2}$$

$$y = \frac{15}{4}x - \frac{13}{4}$$
Yint =  $(0, -\frac{13}{4})$ 

$$9int = (0, -13/4)$$

$$\frac{15}{4}x = \frac{13}{4} \qquad x = \frac{13}{15} \qquad (\frac{13}{15}, 0)$$

$$\frac{1}{2} + \frac{13}{15} + \frac{13}{4} = \frac{169}{120}$$
b)  $\frac{dy}{dz} = 0$  @ stationary point.

$$2x - 2x^{-3} = 0$$

$$2x = \frac{2}{x^{3}} \qquad x = \pm 1$$

$$\frac{1}{2}y = 2 - 2(-3)x^{-4}$$

$$\frac{1}{3}$$

$$\frac{1}{15}$$

when x=+1  $2+6(1)^{-4}=8$ 8>0: this is a min. point

When x = -1  $2+6(-1)^{-4} = 8$ Again this is a min point

Two stationary points are minimum: there is no max point (As required)
