Condone $3y + 5x = 40$ Iternative Rearranges $5x + 3y = 40$ to $y = -\frac{5}{3}x +$ Complete attempt to show that the equation of line l_2 is perpendicular to l_1 through $B(8,0)$. Requires: • either $-\frac{5}{3}$ is the negative reciprocal of $\frac{3}{5}$ or shows $-\frac{5}{3} \times \frac{3}{5} = -1$	(8 n l gradient. r as $c =$ the line betw and that it	een

(b) B1: Deduces A(-10,0) May be awarded on the diagram as -10 or within a calculation. For the attempt to solve $y = \frac{3}{5}x + 6$ (or e.g., 5y - 3x = 30) and 5x + 3y = 40M1: simultaneously to find the *y* coordinate of their point of intersection. May be implied, i.e., from a calculator solution which must be correct to 1d.p. They should be using the given equations but allow slips in rearranging. y coordinate of C is $\frac{135}{17}$ (Accept awrt 7.9 for this mark) A1: dM1: Scored for a complete and correct attempt to find the exact area of triangle ABC. There may be numerical slips, e.g., in finding the x coordinates of A, but, e.g., the x and y coordinates should not be used the wrong way round. Do not allow the use of decimals in place of exact values as they cannot meet the demand of the question. See scheme using just the *y* coordinate of *C*. Another option is to use Pythagoras' theorem to find AC and BC lengths using A(-10,0), B(8,0) and their $C\left(\frac{55}{17},\frac{135}{17}\right)$ Note: $AC = \frac{45\sqrt{34}}{17}$ and $BC = \frac{27\sqrt{34}}{17}$ Proceeds correctly to area $ABC = \frac{1215}{17}$ A1: (b) Alternative – you might see the following from Further Maths candidates: B1M1A1 as above. **dM1:** $\frac{1}{2} \begin{vmatrix} 8 & \frac{55}{17} & -10 & 8 \\ 0 & \frac{135}{17} & 0 & 0 \end{vmatrix} = \frac{1}{2} \left(8 \times \frac{135}{17} & -10 \times \frac{135}{17} \right)$ or $\frac{1}{2} \begin{vmatrix} 8 & 0 & 1 \\ \frac{55}{17} & \frac{135}{17} & 1 \\ \frac{-10}{0} & 0 & 1 \end{vmatrix} = \frac{1}{2} \left(8 \times \frac{135}{17} - \frac{-10}{17} \times \frac{135}{17} \right)$ Proceeds correctly to area $ABC = \frac{1215}{17}$ A1:

Quest	on Scheme	Marks	AOs				
2 (a)	$\overrightarrow{AB} = \overrightarrow{OB} - \overrightarrow{OA} = (-8\mathbf{i} + 9\mathbf{j}) - (10\mathbf{i} - 3\mathbf{j})$	M1	1.1b				
	=-18i+12j	Al	1.1b				
		(2)					
(b	$\left \overrightarrow{AB} \right = \sqrt{"18"^2 + "12"^2} \left\{ = \sqrt{468} \right\}$	M1	1.1b				
	$=6\sqrt{13}$	Al	1.1b				
		(2)					
(c)	attempt to find "p" $\overrightarrow{AB} = \lambda \overrightarrow{BC} \Rightarrow -18\mathbf{i} + 12\mathbf{j} = 6\lambda\mathbf{i} + \lambda(p-9)\mathbf{j}$ with components equated	M1	2.1				
	leading to a value for λ and to $p = \dots$						
	(i) $p = 5$	Al	1.1b				
	(ii) ratio = 2: 3	B1 (A1 on EPEN)	2.2a				
		(3)					
		(7 n	narks)				
Notes							
M1: A1:	Must be seen in (a) Attempts subtraction either way round. This cannot be awarded for adding the two vectors. If no method shown it may be implied by one correct component. Allow as coordinates for this mark. Condone missing brackets, e.g., $-8i+9j-10i-3j$ are $-18i+12j$ o.e. $\begin{pmatrix} -18\\12 \end{pmatrix}$ Condone $\begin{pmatrix} -18\\12 \end{pmatrix}$ Do not allow $\begin{pmatrix} -18i\\12j \end{pmatrix}$ or $(-18, 12)$ or $\begin{pmatrix} -18\\12 \end{pmatrix}$ for the A1.						
(b) M1: A1:	Attempts to use Pythagoras' theorem on their vector from part (a). Allow restarts. $\left \overline{AB}\right = \sqrt{"18"^2 + "12"^2} \left\{= \sqrt{468}\right\}$ Note that -18 will commonly be squared as 18 May be implied by awrt 21.6 This will need checking if (a) is incorrect. cao $6\sqrt{13}$ May come from $\begin{pmatrix}\pm 18\\\pm 12\end{pmatrix}$						
	For the key step in using the fact that <i>BCA</i> forms a straight line in an attempt to find " <i>p</i> " Condone sign slips. Award, for example, for $\pm \frac{p-9}{6} = \pm \frac{2}{3}$ leading to $p = \dots$						
	It is implied by $p = 5$ unless it comes directly from work that is clearly incorrect.						
	P = 0 where $P = 0$ where						

e.g., award for an attempt to use

- $\overrightarrow{AB} = \alpha \overrightarrow{AC} \Rightarrow -18\mathbf{i} + 12\mathbf{j} = -12\alpha\mathbf{i} + \alpha(p+3)\mathbf{j}$ with components equated leading to a value for α and to $p = \dots$
- gradient BC = gradient $BA = -\frac{2}{3}$ e.g., $\frac{p-9}{6} = \frac{9--3}{-8-10}$ leading to $p = \dots$

• triangles *BCM* and *BAN* are similar with lengths in a ratio 1:3. e.g., $p = 9 - \frac{1}{3} \times 12$ or

$$p = -3 + \frac{2}{3} \times 12$$

• attempt to find the equation of line *AB* using both points (FYI line *AB* has equation $y = -\frac{2}{3}x + \frac{11}{3}$) and then sub in x = -2 leading to p = ...

•
$$\frac{p+3}{12} = \frac{2}{3}$$
 or $\frac{p+3}{2} = 9 - p$ leading to $p = \dots$

- A1: p=5 Correct answer implies both marks, unless it comes directly from work that is clearly incorrect.
- **B1**: States ratio = 2: 3 or equivalent such as 1: 1.5 or 22:33 Note that 3:2 is incorrect but condone {Area}AOB : {Area}AOC = 3: 2 This might follow incorrect work or even incorrect *p* For reference, area AOC = 22, area AOB = 33 and area BOC = 11

Question	Scheme	Marks	AOs
3 (a)	(i) $x^{2} + y^{2} - 10x + 16y = 80 \Rightarrow (x - 5)^{2} + (y + 8)^{2} =$	M1	1.1b
	Centre (5, -8)	A1	1.1b
	(ii) Radius 13	A1	1.1b
		(3)	
(b)	Attempts $\sqrt{"5"^2 + "8"^2} + "13"$	M1	3.1a
	$13 + \sqrt{89}$ but ft on their centre and radius	Alft	1.1b
		(2)	
	1		(5 marks

(a)(i)

M1: Attempts to complete the square on **both** *x* and *y* terms.

Accept
$$(x\pm 5)^2 + (y\pm 8)^2 = ...$$
 or imply this mark for a centre of $(\pm 5, \pm 8)$

Condone
$$(x\pm 5)^2$$
.... $(y\pm 8)^2$ = ... where the first ... could be, or even –

A1: Correct centre (5, -8).

Accept without brackets. May be written x = 5, y = -8 (a)(ii)

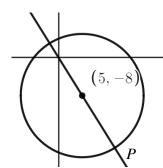

A1: 13. The M mark must have been awarded, so it can be scored following a centre of $(\pm 5, \pm 8)$. Do not allow for $\sqrt{169}$ or ± 13

(b)

M1: Attempts $\sqrt{5^{*}+8^{*}} + 13^{*}$ for their centre (5, -8) and their radius 13.

Award when this is given as a decimal, e.g. 22.4 for correct centre and radius. Look for $\sqrt{a^2 + b^2} + r$ where centre is $(\pm a, \pm b)$ and radius is r

A1ft: $13 + \sqrt{89}$ Follow through on their (5, -8) and their 13 leading to an exact answer. ISW for example if they write $13 + \sqrt{89} = 22.4$

There are more complicated attempts which could involve finding *P* by solving $y = "-\frac{8}{5}x"$ and

 $x^2 + y^2 - 10x + 16y = 80$ simultaneously and choosing the coordinate with the greatest modulus. The method is only scored when the distance of the largest coordinate from *O* is attempted. Such methods are unlikely to result in an exact value but can score 1 mark for the method. Condone slips

FYI. Solving
$$y = -\frac{8}{5}x$$
 and $x^2 + y^2 - 10x + 16y = 80 \Rightarrow 89x^2 - 890x - 2000 = 0 \Rightarrow P = (11.89, -19.02)$

Hence
$$OP = \sqrt{"11.89"^2 + "19.02"^2} (= 22.43)$$
 scores M1 A0 but $OP = \sqrt{258 + 26\sqrt{89}}$ is M1 A1
