1. The temperature of a freezer is -20°C. A container of a liquid is placed in the freezer. The rate at which the temperature, θ°C, of a liquid decreases is proportional to the difference in temperature between the liquid and its surroundings. The situation is modelled by the differential equation

$$\frac{\mathrm{d}\theta}{\mathrm{d}t} = -k(\theta + 20)$$

where time t is in minutes and k is a positive constant.

i. Express  $\theta$  in terms of *t*, *k* and an arbitrary constant.

[3]

Initially the temperature of the liquid in the container is 40°C and, at this instant, the liquid is cooling at a rate of 3°C per minute. The liquid freezes at 0°C.

ii. Find the value of *k* and find also the time it takes (to the nearest minute) for the liquid to freeze.

[5]

The procedure is repeated on another occasion with a different liquid. The initial temperature of this liquid is 90°C. After 19 minutes its temperature is 0°C.

- iii. Without any further calculation, explain what you can deduce about the value of *k* in this case.
- [1]
- 2. At time *t* seconds, the radius of a spherical balloon is *r* cm. The balloon is being inflated so that the rate of increase of its radius is inversely proportional to the square root of its radius. When t = 5, r = 9 and, at this instant, the radius is increasing at 1.08 cm s<sup>-1</sup>.
  - i. Write down a differential equation to model this situation, and solve it to express *r* in terms of *t*.
    - [7]

[2]

ii. How much air is in the balloon initially?

[The volume of a sphere is  $V = \frac{4}{3}\pi r_{.]}^3$ 

3. A container in the shape of an inverted cone of radius 3 metres and vertical height 4.5 metres is initially filled with liquid fertiliser. This fertiliser is released through a hole in the bottom of the container at a rate of 0.01 m<sup>3</sup> per second. At time *t* seconds the fertiliser remaining in the container forms an inverted cone of height *h* metres.

[The volume of a cone is 
$$V = \frac{1}{3}\pi r^2 h_{...}$$
]

i. Show that 
$$h^2 \frac{\mathrm{d}h}{\mathrm{d}t} = -\frac{9}{400\pi}$$
.

- ii. Express *h* in terms of *t*.
- iii. Find the time it takes to empty the container, giving your answer to the nearest minute.
- 4. In the year 2000 the population density, *P*, of a village was 100 people per km<sup>2</sup>, and was increasing at the rate of 1 person per km<sup>2</sup> per year. The rate of increase of the population density is thought to be inversely proportional to the size of the population density. The time in years after the year 2000 is denoted by *t*.
  - i. Write down a differential equation to model this situation, and solve it to express P in terms of t.
  - ii. In 2008 the population density of the village was 108 people per km<sup>2</sup> and in 2013 it was 128 people per km<sup>2</sup>. Determine how well the model fits these figures.

5.

$$\frac{16+5x-2x^2}{(x+1)^2(x+4)}$$
 Express  $(x+1)^2(x+4)$  in partial fractions.

**Differential Equations** 

[2]

[5]

[4]

ii. It is given that

$$\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{(16+5x-2x^2)y}{(x+1)^2(x+4)}$$

and that  $y = \frac{1}{256}$  when x = 0. Find the exact value of y when x = 2. Give your answer in the form  $Ae^{n}$ .

[7]

[5]

- 6. Helga invests £4000 in a savings account. After *t* days, her investment is worth £*y*. The rate of increase of *y* is *ky*, where *k* is a constant.
  - (a) Write down a differential equation in terms of *t*, *y* and *k*. [1]
  - (b) Solve your differential equation to find the value of Helga's investment after t days.
     Give your answer in terms of k and t.
     [4]

$$k = \frac{1}{365} \ln \left( 1 + \frac{r}{100} \right)$$

It is given that 100 where r% is the rate of interest per annum. During the first year the rate of interest is 6% per annum.

(c) Find the value of Helga's investment after 90 days. [2]

After one year (365 days), the rate of interest drops to 5% per annum.

(d) Find the total time that it will take for Helga's investment to double in value. [5]

7. A new bird species is introduced into a region where it has previously been absent. Initially 20 birds are introduced. The rate of increase of the number *N* of birds after *t* years is modelled by

$$\frac{1}{1000}$$
 (10000 –  $N^2$ ).

(a) 
$$N = \frac{100(3e^{0.2t} - 2)}{(3e^{0.2t} + 2)}.$$

- (b) Hence explain what will happen to the number of birds over a long period of time, as predicted by the model.
- (c) State one limitation of the model.
- 8. A tank is shaped as a cuboid. The base has dimensions 10 cm by 10 cm. Initially the tank is empty. Water flows into the tank at 25 cm<sup>3</sup> per second. Water also leaks out of the tank at  $4h^2$  cm<sup>3</sup> per second, where *h* cm is the depth of the water after *t* seconds. Find the time taken for the water to reach a depth of 2 cm. [9]
- 9. A scientist is attempting to model the number of insects, N, present in a colony at time t weeks. When t = 0 there are 400 insects and when t = 1 there are 440 insects.
  - (a) A scientist assumes that the rate of increase of the number of insects is inversely proportional to the number of insects present at time t.
    - (i) Write down a differential equation to model this situation. [1]
    - (ii) Solve this differential equation to find *N* in terms of *t*.

(b) In a revised model it is assumed that 
$$\frac{dIV}{dt} = \frac{IV}{3988e^{0.2t}}$$
. Solve this differential [6] equation to find *N* in terms of *t*.

1 17

NT2

- (c) Compare the long-term behaviour of the two models.
- 10. The gradient of the curve y = f(x) is given by the differential equation

$$(2x-1)^3 \frac{dy}{dx} + 4y^2 = 0$$

and the curve passes through the point (1, 1). By solving this differential equation show that

[2]

[7]

[1]

[4]

[2]

**Differential Equations** 

$$f(x) = \frac{ax^2 - ax + 1}{bx^2 - bx + 1} ,$$

where *a* and *b* are integers to be determined.

11.

The gradient function of a curve is given by  $\frac{dy}{dx} = \frac{x^2 \sin 2x}{2 \cos^2 4y - 1}$ 

(a) Find an equation for the curve in the form f(y) = g(x)

The curve passes through the point  $(\frac{1}{4}\pi, \frac{1}{12}\pi)$ .

- (b) Find the smallest positive value of y for which x = 0.
- 12. As a spherical snowball melts its volume decreases. The rate of decrease of the volume of the snowball at any given time is modelled as being proportional to its volume at that time. Initially the volume of the snowball is 500 cm<sup>3</sup> and the rate of decrease of its volume is 20 cm<sup>3</sup> per hour.
  - (a) Find the time that this model would predict for the snowball's volume to decrease to [7] 250 cm<sup>3</sup>.
  - (b) Write down one assumption made when using this model.
  - (c) Comment on how realistic this model would be in the long term. [1]

## Mark scheme

Que	stion	Answer/Indicative content	Marks	Part marks and guidance
1	i	$\int \frac{1}{\theta + 20}  \mathrm{d}\theta = \int -k  \mathrm{d}t$	M1	$\frac{\mathrm{d}t}{\mathrm{or\ invert\ each\ side:}} = -\frac{1}{k(\theta + 20)} \qquad \qquad \frac{1}{\mathrm{Must\ see\ }\frac{1}{\theta + 20}};$ ignore posn 'k'
	i	$ln(\theta + 20) = -kt(+c)$ or equivalent	A1	"Eqn A"
				"Eqn B"
				Examiner's Comments
	i	$\theta = Ae^{-kt} - 20$ oe (i.e. $0 = e^{-kt + c} - 20$ )	A1	The majority of candidates used the method of 'separating the variables' and generally integrated each side correctly. However, many did not go further or failed to rearrange this equation correctly in order to express $\theta$ in terms of <i>t</i> , <i>k</i> and an arbitrary constant. Many candidates thought that '+ c' should appear only at the end. A very few inverted each side and were generally less successful because of the position of ' <i>K</i> ' immediately alongside the $\theta$ + 20 in the denominator.
	ii	(-)3 = -k(40 + 20)	M1	Using $t = 0, \theta = 40, \frac{d\theta}{dt} = (-)3$ equation
	ii	$k = \frac{1}{20}  \text{oe}$	*A1	$k = -\frac{1}{20}$ Examiner's Comments There were some very good and neat solutions to this part, particularly by those who read the question carefully before delving into its solution. Even though <i>k</i> was defined to be a

					positive constant, a large number of candidates obtained $k = -\frac{1}{20}$ . A few interpreted the statement "at this instant, the liquid is cooling" to imply that there was a constant decrease of 3 degrees every minute. However, many candidates attempted to use all the information correctly and found <i>k</i> , their own constant of integration and, finally, the time taken for the liquid to freeze.	Differential Equations

ii	$h = \sqrt[3]{\frac{729}{8} - \frac{27t}{400\pi}}$ oe isw	A1	Examiner's Comments This proved surprisingly difficult for many. Those who did separate the variables either differentiated <i>h</i> <sup>2</sup> instead of integrating, or omitted the constant of integration and made no further progress. Those who did achieve a correct value for " <i>c</i> " often went on to spoil their answer, or simply left the equation in implicit form.	91.125 = <sup>729</sup> / <sub>8</sub>
	set $h = 0$ and solve to obtain positive $t$	M1	or $(t = 1)$ $\frac{1}{3}\pi \times 3^2 \times 4.5 \div 0.01$ (= 1350 $\pi$ )	NB 1350π = 4241.150082
iii	71 minutes cao	A1	<b>Examiner's Comments</b> Most realised that setting $h = 0$ was required here. Due to earlier errors, this sometimes led to a negative value for $t$ ; surprisingly this did not always set the alarm bells ringing. A good proportion of candidates who did everything right lost an easy mark because they failed to convert the answer to	

				minutes. Some candidates who had made no progress earlier, were astute enough to realise that the correct answer could be obtained without the result from part (ii), as the rate of change of volume was constant.	Differential Equations
		Total	11		
4	i	$\frac{\mathrm{d}P}{\mathrm{d}t} = \frac{k}{P}$	B1	or $\frac{\mathrm{d}P}{\mathrm{d}t} = \frac{1}{kP}$	<i>k</i> should be unspecified at this stage
	i	$\frac{\mathrm{d}P}{k=100 \text{ from }} = \frac{k}{P}$	B1	or $k = 0.01$ from $\frac{\mathrm{d}P}{\mathrm{d}t} = \frac{1}{kP}$	may be seen later
	i	$\int \mathcal{P} d\mathcal{P} = \int (\text{their } k) dt$	M1*	allow $k = 1$	allow omission of ∫ and recovery of omission of one operator for M1*A1
	i	$\frac{P^2}{2} = kt + c$	A1	$\int_{\text{or}} t = \frac{P^2}{2k} + d$	if <b>M0</b> , <b>SC2</b> for $\ln P = kt + c$ thereafter only <b>M1</b> may be earned
	i	substitution of $t = 0$ and $P = 100$	M1dep*	may follow incorrect algebraic manipulation, but equation must include $c$ (or $d$ )	NB <i>c</i> = 5000 or <i>d</i> = – 50
	i	$P = \sqrt{10000 + 200t}$ or $10\sqrt{100 + 2t}$ or $P = \sqrt{200(50 + t)}$ isw cao	A1		allow recovery from eg use of <i>x</i> for <i>P</i> throughout, but withhold final A1 for eg $x = \sqrt{10000 + 200t}$
				Examiner's Comments	
				A surprising number of candidates did not seem to	
				understand inverse proportion, and setting up the initial equation elicited a wide range of incorrect responses. Those	
	i			who did set up the equation correctly usually went on to earn	
				at least four marks out of six. Finding k caused more difficulty	
				than expected: many candidates mistakenly assuming that $t = 1$ , $P = 101$ was a valid pair of values, instead of working	
				with the information given in the question. In some cases	

				rearranging to make ${\cal P}$ the subject of the formula proved troublesome.	Differential Equations
	ii	<i>t</i> = 8, <i>P</i> = 107.7 or 108 so model was a good fit in 2008 oe	B1	or $t = 8.3(2)$ when $P = 108 + \text{comment}$	value of <i>P</i> or <i>t</i> must be found and correct comment made in each case; comments may be in same sentence.
				or <i>t</i> = 31.9(2) or 32 when <i>P</i> = 128 + comment	if <b>B0B0, SC1</b> for both values found no FT marks available
	ii	t = 13, $P = 112(.2)$ , so model was not appropriate in 2013 oe	B1	comments may be in same sentence, but both values must be referenced	comments on trends, extrapolation etc do not score just ticks / crosses etc do not score
				Examiner's Comments	
	ii			Full marks were rarely achieved in this case. Those who did find the correct values often speculated on future trends rather than commenting on the two values they had found. It was necessary to have earned at least four marks in part (i) to score in this part.	
		Total	8

				Examiner's Comments The responses to this final question in the pure section were mixed with examiners reporting a mixture of excellent responses followed by those that struggled with both the integration and the resulting algebraic manipulation required to obtain the answer in the required form. While most correctly separated the variables and wrote $\begin{bmatrix} -\frac{1}{4} \int \frac{dy}{y^2} = \int \frac{dx}{(2x-1)^3} & \text{many}\\ \text{candidates} \end{bmatrix}$ had issues with the placement of the fraction on the left-hand side with examiners reporting that frequently this became a 4 rather than remaining as a quarter. While many candidates correctly integrated and remembered to include an arbitrary constant many decided to re-arrange their equation before attempting to find this constant; candidates are advised that in the majority of situations it is probably wisest to work out the + <i>c</i> immediately. Of those that obtained a correct particular solution to this differential equation, for example, $\begin{bmatrix} 1\\y = -\frac{1}{(2x-1)^2} + 2 & \text{many did not}\\ \text{know} \end{bmatrix}$ the correct method for obtaining the result for f(x) in the required form. Many candidates took the reciprocal of each term separately rather than combining all relevant fractions first before taking the reciprocal and then expanding the brackets.	Differential Equations
