

# Trigonometric identities Cheat Sheet

## Angles in all four quadrants

### Unit circles:

A unit circle is a circle with radius of 1 unit. It will help you understand the trigonometric ratios.

For a point  $P(x, y)$  on a unit circle such that  $OP$  making an angle with the positive  $x$ -axis  
 $\cos \theta = x$ -coordinate of  $P$   
 $\sin \theta = y$ -coordinate of  $P$   
 $\tan \theta = \frac{y}{x}$  = gradient of  $OP$   
 You always start measuring  $\theta$  from positive  $x$ -axis  
 Positive angles  $\leftarrow$  Anti-clock wise  
 Negative angles  $\leftarrow$  Clockwise

With the help of unit circle you can find values and signs of sine, cosine and tangent.

The  $x$ - $y$  plane is divided into quadrants:

Angles may lie outside the range  $0$ - $360^\circ$ , but they always lie in one of the four quadrants.  
 For e.g.  $520^\circ$  is equivalent to  $520^\circ - 360^\circ = 160^\circ$  which lies in second quadrant

### Example 1:

Find the signs of  $\sin \theta$ ,  $\cos \theta$  and  $\tan \theta$  in the second quadrant.

Draw a circle with centre  $O$  and radius  $1$ , with  $P(x, y)$  in the second quadrant.

You know that  $x$  is  $-ve$  and  $y$  is  $+ve$  in the second quadrant  
 $\sin \theta = +ve$ ,  $\cos \theta = -ve$   
 $\tan \theta = \frac{+ve}{-ve} = -ve$   
 So, only  $\sin \theta$  is  $+ve$  in the second quadrant

With the help of the following diagram, you can determine the signs of each of the trigonometric ratios

Only  $\sin \theta$  is positive for angle  $\theta$  in the second quadrant.

Only  $\tan \theta$  is positive for angle  $\theta$  in the third quadrant

$\sin \theta$ ,  $\cos \theta$  and  $\tan \theta$  are all positive for angle  $\theta$  in the first quadrant.

Only  $\cos \theta$  is positive for angle  $\theta$  in the fourth quadrant.

You can use the following rules to find  $\sin$ ,  $\cos$  or  $\tan$  of any positive or negative angle using the corresponding acute angle made with the  $x$ -axis

$$\begin{aligned} \sin(180^\circ - \theta) &= +\sin \theta \\ \sin(180^\circ + \theta) &= -\sin \theta \\ \sin(360^\circ - \theta) &= -\sin \theta \end{aligned}$$

$$\begin{aligned} \tan(180^\circ - \theta) &= -\tan \theta \\ \tan(180^\circ + \theta) &= +\tan \theta \\ \tan(360^\circ - \theta) &= -\tan \theta \end{aligned}$$

$$\begin{aligned} \cos(180^\circ - \theta) &= -\cos \theta \\ \cos(180^\circ + \theta) &= -\cos \theta \\ \cos(360^\circ - \theta) &= \cos \theta \end{aligned}$$

### Example 2:

Express the following in terms of trigonometric ratios of acute angles.

- a.  $\sin 240^\circ$  b.  $\cos(-50^\circ)$

The angle  $240^\circ$  is obtuse and measured from the  $+ve$   $x$ -axis anti-clockwise.  
 So the acute angle is  $60^\circ$   
 $\sin$  is  $-ve$  in the third quadrant  
 So  $\sin 240^\circ = -\sin 60^\circ$

- b.

The angle  $-50^\circ$  is the angle measured from the positive  $x$ -axis clockwise.  
 $50^\circ$  is the acute angle.  
 $\cos$  is  $+ve$  in the fourth quadrant  
 So  $\cos(-50^\circ) = \cos 50^\circ$

### Example 3:

Given that  $\theta$  is an acute angle, express  $\tan(\theta - 540^\circ)$  in terms of  $\tan \theta$

To express  $\tan(\theta - 540^\circ)$  in terms of  $\tan \theta$ , we need to find in which quadrant the angle  $\theta - 540^\circ$  lies.

You know that  $540^\circ$  is equivalent to  $540^\circ - 360^\circ = 180^\circ$

$\Rightarrow -540^\circ$  is equivalent to  $-180^\circ \Rightarrow 180^\circ$  clockwise and  $\theta =$  anti-clockwise

So first you will go  $180^\circ$  clockwise and then  $\theta$  anti-clockwise which will be in the third quadrant.

$\tan$  is  $+ve$  in the third quadrant

Hence,  $\tan(\theta - 540^\circ) = \tan \theta$

### Exact values of trigonometric ratios.

You can find exact values of  $\sin$ ,  $\cos$  and  $\tan$  of  $30^\circ$ ,  $45^\circ$  and  $60^\circ$ . Please refer the table below for the exact values.

|               | $30^\circ$                                | $45^\circ$           | $60^\circ$           |
|---------------|---|----------------------|----------------------|
| $\sin \theta$ | $\frac{1}{2}$                             | $\frac{1}{\sqrt{2}}$ | $\frac{\sqrt{3}}{2}$ |
| $\cos \theta$ | $\frac{\sqrt{3}}{2}$                      | $\frac{1}{\sqrt{2}}$ | $\frac{1}{2}$        |
| $\tan \theta$ | $\frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}$ | 1                    | $\sqrt{3}$           |

### Trigonometric Identities:

Equation of unit circle is  $x^2 + y^2 = 1$

As we know  $\cos \theta = x$  and  $\sin \theta = y \Rightarrow \cos^2 \theta + \sin^2 \theta = 1$

For all values of  $\theta$ ,  $\sin^2 \theta + \cos^2 \theta \equiv 1$

For all values of  $\theta$ , such that  $\cos \theta \neq 0$ ,  $\tan \theta \equiv \frac{\sin \theta}{\cos \theta}$

You can use the above identities to simplify trigonometric expressions and complete proofs

# Edexcel Pure Year 1

Example 4: Simplify a.  $5 \sin^2 3\theta + 5 \cos^2 3\theta$  b.  $\frac{\sqrt{1-\cos^2 x}}{\cos x}$

a. Start by factorising the equation  
 $\Rightarrow 5(\sin^2 3\theta + \cos^2 3\theta)$   
 $\Rightarrow 5 \times 1 = 5$  As  $\sin^2 \theta + \cos^2 \theta \equiv 1 \Rightarrow \sin^2 3\theta + \cos^2 3\theta = 1$

b.  $\frac{\sqrt{1-\cos^2 x}}{\cos x} = \frac{\sqrt{\sin^2 \theta}}{\cos \theta}$  As  $\cos^2 \theta + \sin^2 \theta = 1 \Rightarrow (\sin^2 \theta = 1 - \cos^2 \theta)$   
 $\Rightarrow \frac{\sqrt{1-\cos^2 x}}{\cos x} = \frac{\sin \theta}{\cos \theta} = \tan \theta$

### Simple Trigonometric equations.

In this section you will learn to solve simple trigonometric equations of the form  $\sin \theta = k$ ,  $\cos \theta = k$  (where  $-1 \leq k \leq 1$ ) and  $\tan \theta = p$  (where  $p \in \mathbb{R}$ )  
 $-1 \leq k \leq 1$  as  $\sin$  and  $\cos$  has maximum = 1 and minimum =  $-1$   
 $p \in \mathbb{R}$  as  $\tan$  has no maximum or minimum value

Example 5: Solve the equation  $2 \cos \theta = -\sqrt{2}$  for  $\theta$ , in the interval  $0 \leq x \leq 360^\circ$

First rearrange the equation in the form  $\cos \theta = k$

So  $\cos \theta = \frac{-\sqrt{2}}{2} = -0.7071$  The values you get on calculator taking inverse of trigonometric functions are called principal values. But principal values will not always be a solution to the equation.  
 $\theta = \cos^{-1}(-0.7071) = 45^\circ$

As  $\cos \theta = -0.7071$  and  $\theta = 45^\circ \Rightarrow \cos$  is negative so you need to look  $\theta$  in the 2<sup>nd</sup> and 4<sup>th</sup> quadrant  
 $45^\circ$  is the acute angle (i.e angle made with the horizontal axis) but we are looking for the angle made from the positive  $x$ -axis anti-clockwise.  
 So, there are two solutions  
 $180^\circ - 45^\circ = 135^\circ$  and  $180^\circ + 45^\circ = 225^\circ$   
 Hence,  $\theta = 135^\circ$  or  $\theta = 225^\circ$

### Harder trigonometric equations:

You will have to solve equations of the form  $\sin n\theta = k$ ,  $\cos n\theta = k$  and  $\tan n\theta = p$   
 $\sin(\theta + \alpha) = k$ ,  $\cos(\theta + \alpha) = k$  and  $\tan(\theta + \alpha) = p$   
 It is same as solving simple equations, but will have some extra steps

Example 6: Solve the equation  $\sin(x + 60^\circ) = 0.3$  in the interval  $0 \leq x \leq 360^\circ$

Let  $X = x + 60^\circ \Rightarrow \sin X = 0.3$   
 The interval for  $X$  will be  $0 + 60^\circ \leq X \leq 360^\circ + 60^\circ \Rightarrow 60^\circ \leq X \leq 420^\circ$   
 $X = \sin^{-1} 0.3 = 17.45^\circ$ , principal value  
 $\sin$  is positive which mean  $17.45^\circ$  should be in the 1<sup>st</sup> and 2<sup>nd</sup> quadrant.  
 One of the solution will be  $180^\circ - 17.45^\circ = 162.54^\circ$   
 Now the other solution could be  $17.45^\circ$  but  $60^\circ \leq X \leq 420^\circ$ , so it cannot be  $17.45^\circ$ .  
 So start from  $+ve$   $x$ -axis and measure one full circle i.e.  $360^\circ$  and add  $17.5^\circ$   
 $\Rightarrow 360^\circ + 17.45^\circ = 377.45^\circ$  So  $X = 162.54^\circ, 377.45^\circ$   
 Subtract  $60^\circ$  from each value: Hence,  $x = 102.5^\circ$  or  $317.5^\circ$

### Equations and Identities:

You will have to solve quadratics equations in  $\sin \theta$ ,  $\cos \theta$  and  $\tan \theta$

Example 7: Solve for  $\theta$ , in the interval  $0 \leq x \leq 360^\circ$ , the equation  $2 \cos^2 \theta - \cos \theta - 1 = 0$

Start by factorising the equation as you do for quadratic equation  
 $2 \cos^2 \theta - \cos \theta - 1 = 0$  Compare with  $2x^2 - x - 1 = (2x + 1)(x - 1)$   
 So  $(2 \cos \theta + 1)(\cos \theta - 1) = 0$   
 $\cos \theta = -\frac{1}{2}$  or  $\cos \theta = 1$  Set each factor equal to 0 thereby finding two sets of solutions  
 $\cos \theta = -\frac{1}{2} \Rightarrow \theta = 60^\circ$   
 Cosine is negative implies solution is in the 2<sup>nd</sup> and 3<sup>rd</sup> quadrants  
 In the 2<sup>nd</sup> quadrant  $\theta = 180 - 60 = 120^\circ$ . So, one solution is  $120^\circ$   
 In the 3<sup>rd</sup> quadrant  $\theta = 180 + 60 = 240^\circ$ .  
 So, the other solution in the 3<sup>rd</sup> quadrant will be  $240^\circ$   
 $\cos \theta = 1$  so  $\theta = 0$  or  $360^\circ$   
 So the solutions are  
 $\theta = 0^\circ, 120^\circ, 240^\circ, 360^\circ$
