

1. The unit vectors  $\mathbf{i}$  and  $\mathbf{j}$  shown in Fig. 2 are in the horizontal and vertically upwards directions.

**Fig. 2**

Forces  $\mathbf{p}$  and  $\mathbf{q}$  are given, in newtons, by  $\mathbf{p} = 12\mathbf{i} - 5\mathbf{j}$  and  $\mathbf{q} = 16\mathbf{i} + 1.5\mathbf{j}$ .

- i. Write down the force  $\mathbf{p} + \mathbf{q}$  and show that it is parallel to  $8\mathbf{i} - \mathbf{j}$ .

[3]

- ii. Show that the force  $3\mathbf{p} + 10\mathbf{q}$  acts in the horizontal direction.

[2]

- iii. A particle is in equilibrium under forces  $k\mathbf{p}$ ,  $3\mathbf{q}$  and its weight  $\mathbf{w}$ .

Show that the value of  $k$  must be  $-4$  and find the mass of the particle.

[3]

2. Two points, A and B, have position vectors  $\mathbf{a} = \mathbf{i} - 3\mathbf{j}$  and  $\mathbf{b} = 4\mathbf{i} + 3\mathbf{j}$ . The point C lies on the line  $y = 1$ . The lengths of the line segments AC and BC are equal. Determine the position vector of C.

[4]

3. OACB is a parallelogram. O is the origin and point A has coordinates (5, 6). Point B has position vector

$$\mathbf{b} = -2\mathbf{i} - 7\mathbf{j}.$$

- (a) Find the coordinates of point C.

[3]

M is the midpoint of AB.

- (b) Prove that  $\overrightarrow{OM} = \overrightarrow{MC}$ .

[3]

- (c) Find the exact distance MC.

Question		Answer/Indicative content	Marks	Guidance
1	i	$\mathbf{p} + \mathbf{q} = 28\mathbf{i} - 3.5\mathbf{j}$	B1	
	i	$28\mathbf{i} - 3.5\mathbf{j} = k(8\mathbf{i} - \mathbf{j})$	M1	Or equivalent. $k$ may be implied by going straight to 3.5
		$k = 3.5$		
	i	(So they are parallel)	A1	
		<b>Alternative</b> $\mathbf{p} + \mathbf{q} = 28\mathbf{i} - 3.5\mathbf{j}$		
	i	$\mathbf{p} + \mathbf{q}: \tan \theta = \frac{-3.5}{28} \Rightarrow \theta = -7.13^\circ$	B1	
	i	$8\mathbf{i} - \mathbf{j}: \tan \theta = \frac{-1}{8} \Rightarrow \theta = -7.13^\circ$	M1	Comparing the ratio of the components in each of the two vectors is sufficient, using any consistent sign convention. The angle does not need to be worked out, nor does tan have to be seen.
	i	So they are parallel	A1	Both ratios the same and correct
	ii	$3\mathbf{p} + 10\mathbf{q} = (36 + 160)\mathbf{i} + (-15 + 15)\mathbf{j}$		
	ii	$= 196\mathbf{i}$	B1	
	ii	Zero $\mathbf{j}$ component so horizontal	B1	Or equivalent explanation. May be shown on a diagram
	iii	The horizontal component must be zero		Substituting $k = -4$ and showing $\mathbf{i}$ component is zero is acceptable  Award for 24.5 seen  Award for 2.5 seen. FT from their weight.
	iii	So $12k + 3 \times 16 = 0 \Rightarrow k = -4$	B1	Substituting $k = -4$ and showing $\mathbf{i}$ component is zero is acceptable
	iii	$\mathbf{w} = -24.5\mathbf{j}$	B1	Award for 24.5 seen  Award for 2.5 seen. FT from their weight.
	iii	$mg = 24.5 \Rightarrow m = 2.5$ The mass is 2.5 kg	B1	<b>Examiner's Comments</b>  This question was about vectors defined using $\mathbf{i}, \mathbf{j}$ notation. It was well answered with many candidates obtaining full marks. Most of the errors that did occur were in part (iii) where candidates were required to interpret the vectors as forces on a particle in equilibrium, with its weight now introduced. Some did

					not interpret the equilibrium conditions sufficiently rigorously, failing to recognise that both the horizontal and vertical components of the resultant had to be zero. The question ended with a request for the mass of the particle and some candidates confused this with its weight.
