## Statistics 3

## Exercise 6F

1 A $3 \times 2$ table has 3 rows ( $h$ ) and 2 columns ( $k$ ) so:
Degrees of freedom $\boldsymbol{v}=(3-1)(2-1)=2$
Critical value is $\chi_{2}^{2}(5 \%)=5.991$
$2 \mathrm{H}_{0}$ : Ownership is not related to the locality. $\mathrm{H}_{1}$ : Ownership is related to the locality.

Degrees of freedom $\nu=(3-1)(2-1)=2$
Critical value is $\chi_{2}^{2}(5 \%)=5.991$
Test statistic $X^{2}=13.1$, which is greater than 5.991 so reject $\mathrm{H}_{0}$ at $5 \%$ significance level and conclude that there is evidence to suggest that ownership of a television is related to the locality.

3 a There are three groups of students and so three rows of data, and three exam classifications so three columns of data. When calculating the expected values, it is not necessary to calculate the last value in each row because it has to equal the row total. Similarly, it is not necessary to calculate the last value in each column because it has to equal the column total.
So degrees of freedom $=(3-1) \times(3-1)=4$
b $\mathrm{H}_{0}$ : There is no association between the student group and the results.
$\mathrm{H}_{1}$ : There is an association between the student group and the results.
Critical value is $\chi_{4}^{2}(5 \%)=9.488$
Test statistic $X^{2}=10.28$, which is greater than 9.488 so reject $\mathrm{H}_{0}$ at $5 \%$ significance level and conclude that there is evidence to suggest an association between the student groups and the exam results they achieve.

## Statistics 3

$4 \mathrm{H}_{0}$ : There is no association between Mathematics and English results.
$\mathrm{H}_{1}$ : There is an association between Mathematics and English results.
These are the observed frequencies $\left(O_{i}\right)$ with totals for each row and column:

|  |  | English grades |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ | Total |  |
| Maths grades | $\mathbf{A}$ | 17 | 28 | 18 | 63 |  |
|  | $\mathbf{B}$ | 38 | 45 | 16 | 99 |  |
|  | C | 12 | 12 | 14 | 38 |  |
|  | Total | 67 | 85 | 48 | 200 |  |

Calculate the expected frequencies $\left(E_{i}\right)$ for each cell. For example:
Expected frequency Mathematics A and English $A=\frac{63 \times 67}{200}=21.105$
The expected frequencies $\left(E_{i}\right)$ are:

|  |  | English grades |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ |  |
| Maths grades | $\mathbf{A}$ | 21.105 | 26.775 | 15.120 |
|  | $\mathbf{B}$ | 33.165 | 42.075 | 23.760 |
|  | $\mathbf{C}$ | 12.730 | 16.150 | 9.120 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{\boldsymbol{i}}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 17 | 21.105 | 0.7985 |
| 28 | 26.775 | 0.0560 |
| 18 | 15.120 | 0.5486 |
| 38 | 33.165 | 0.7049 |
| 45 | 42.075 | 0.2033 |
| 16 | 23.760 | 2.5344 |
| 12 | 12.730 | 0.0419 |
| 12 | 16.150 | 1.0664 |
| 14 | 9.120 | 2.6112 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=8.565$
The number of degrees of freedom $v=(3-1)(3-1)=4$; from the tables: $\chi_{4}^{2}(5 \%)=9.488$
As 8.565 is less than 9.488 , there is insufficient evidence to reject $\mathrm{H}_{0}$ at the $5 \%$ level. This suggest that the Mathematics and English results are independent.

## Statistics $3 \quad$ Solution Bank

$5 \mathrm{H}_{0}$ : There is no association between station and lateness.
$\mathrm{H}_{1}$ : There is an association between station and lateness.

These are the observed frequencies $\left(O_{i}\right)$ with totals for each row and column:

|  |  | On time | Late | Total |
| :---: | :---: | :---: | :---: | :---: |
| Station | $\boldsymbol{A}$ | 26 | 14 | 40 |
|  | $\boldsymbol{B}$ | 30 | 10 | 40 |
|  | $\boldsymbol{C}$ | 44 | 26 | 70 |
|  | Total | 100 | 50 | 150 |

Calculate the expected frequencies $\left(E_{i}\right)$ for each cell. For example:
Expected frequency 'On time' and 'Station $A$ ' $=\frac{40 \times 100}{150}=26.666 \ldots$
The expected frequencies $\left(E_{i}\right)$ are:

|  |  | On time | Late |
| :--- | :---: | :---: | :---: |
| Station | $\boldsymbol{A}$ | 26.666 | 13.333 |
|  | $\boldsymbol{B}$ | 26.666 | 13.333 |
|  | $\boldsymbol{C}$ | 46.666 | 23.333 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{i}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 26 | 26.666 | 0.0166 |
| 14 | 13.333 | 0.0334 |
| 30 | 26.666 | 0.4168 |
| 10 | 13.333 | 0.8332 |
| 44 | 46.666 | 0.1523 |
| 26 | 23.333 | 0.3048 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=1.757$
The number of degrees of freedom $\boldsymbol{v}=(3-1)(2-1)=2$; from the tables: $\chi_{2}^{2}(5 \%)=5.991$
As 1.757 is less than 5.991 , there is insufficient evidence to reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is no reason to believe there is an association between station and lateness.
$6 \mathrm{H}_{0}$ : There is no association between gender and grades.
$\mathrm{H}_{1}$ : There is an association between gender and grades.
The number of degrees of freedom $v=(5-1)(2-1)=4$; from the tables: $\chi_{4}^{2}(1 \%)=13.277$ As $X^{2}(=14.27)$ is greater than 13.277 , reject $\mathrm{H}_{0}$ at the $1 \%$ level. There is evidence to suggest an association between gender and grade.

## INTERNATIONAL A LEVEL

## Statistics 3

## Solution Bank

7 a The contingency table showing observed frequencies is:

|  | Factory |  |  |
| :--- | :---: | :---: | :---: |
|  | $\boldsymbol{A}$ | $\boldsymbol{B}$ | Total |
| OK | 47 | 28 | 75 |
| Defective | 13 | 12 | 25 |
| Total | 60 | 40 | 100 |

b $\mathrm{H}_{0}$ : There is no association between factory and quality.
$\mathrm{H}_{1}$ : There is an association between factory and quality.
Calculate the expected frequencies $\left(E_{i}\right)$ for each cell. For example:
Expected frequency 'OK' and 'Factory $A$ ' $=\frac{75 \times 60}{100}=45$
The expected frequencies $\left(E_{i}\right)$ are:

|  | Factory |  |
| :--- | :---: | :---: |
|  | $\boldsymbol{A}$ | $\boldsymbol{B}$ |
| OK | 45 | 30 |
| Defective | 15 | 10 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{\boldsymbol{i}}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 47 | 45 | 0.0889 |
| 28 | 30 | 0.1333 |
| 13 | 15 | 0.2667 |
| 12 | 10 | 0.4 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=0.8889$
The number of degrees of freedom $\boldsymbol{v}=(2-1)(2-1)=1$; from the tables: $\chi_{1}^{2}(5 \%)=3.841$
As 0.8889 is less than 3.841 , there is insufficient evidence to reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is no reason to believe there is an association between a factory and garment quality.

## INTERNATIONAL A LEVEL

## Statistics 3

$8 \mathrm{H}_{0}$ : There is no association between gender and susceptibility to flu.
$\mathrm{H}_{1}$ : There is an association between gender and susceptibility to flu.
The contingency table showing observed frequencies is:

|  | Boys | Girls | Total |
| :--- | :---: | :---: | :---: |
| Flu | 15 | 8 | 23 |
| No flu | 7 | 20 | 27 |
| Total | 22 | 28 | 50 |

Calculate the expected frequencies $\left(E_{i}\right)$ for each cell. For example:
Expected frequency 'Boy' and 'Flu' $=\frac{23 \times 22}{50}=10.12$
The expected frequencies $\left(E_{i}\right)$ are:

|  | Boys | Girls |
| :--- | :---: | :---: |
| Flu | 10.12 | 12.88 |
| No flu | 11.88 | 15.12 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{\boldsymbol{i}}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 15 | 10.12 | 2.343 |
| 8 | 12.88 | 1.849 |
| 7 | 11.88 | 2.005 |
| 20 | 15.12 | 1.575 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=7.781$
The number of degrees of freedom $\boldsymbol{v}=(2-1)(2-1)=1$; from the tables: $\chi_{1}^{2}(5 \%)=3.841$
As 7.781 is greater than 3.841 , reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is evidence of an association between the gender and susceptibility to flu.

## INTERNATIONAL A LEVEL

## Statistics 3

## Solution Bank

$9 \mathrm{H}_{0}$ : There is no association between choice of beach and the gender of the organisms.
$\mathrm{H}_{1}$ : There is an association between choice of beach and the gender of the organisms.

| Observed ( $\boldsymbol{O}_{\boldsymbol{i}}$ ) |  | Beach |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\boldsymbol{A}$ | $\boldsymbol{B}$ | $\boldsymbol{C}$ | Total |
| Gender | Male | 46 | 80 | 40 | 166 |
|  | Female | 54 | 120 | 160 | 334 |
|  | Total | 100 | 200 | 200 | 500 |

Calculate the expected value for each cell by multiplying column and row totals and dividing by the grand total, for example:

$$
E_{A, M}=\frac{166 \times 100}{500}=33.2
$$

|  |  | Expeach |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\boldsymbol{A}$ | $\boldsymbol{B}$ | $\boldsymbol{C}$ |
| Gender | Male | 33.2 | 66.4 | 66.4 |
|  | Female | 66.8 | 133.6 | 133.6 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{i}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 46 | 33.2 | 0.0166 |
| 80 | 66.4 | 0.0334 |
| 40 | 66.4 | 0.4168 |
| 54 | 66.8 | 0.8332 |
| 120 | 133.6 | 0.1523 |
| 160 | 133.6 | 0.3048 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=27.271$
The number of degrees of freedom $\boldsymbol{v}=(3-1)(2-1)=2$; from the tables: $\chi_{2}^{2}(5 \%)=5.991$
As 27.271 is greater than 5.991 , reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is evidence of an association between the gender of an organism and the beach on which it is found.

## INTERNATIONAL A LEVEL

## Statistics $3 \quad$ Solution Bank

$10 \mathrm{H}_{0}$ : There is no association between age and number of bank cards.
$\mathrm{H}_{1}$ : There is an association between age and number of bank cards.
These are the observed frequencies $\left(O_{i}\right)$ with totals for each row and column:

|  |  | Number of cards |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\leqslant \mathbf{3}$ | $>\mathbf{3}$ | Total |
| Age | $\leqslant \mathbf{3 0}$ | 74 | 20 | 94 |
|  | $>\mathbf{3 0}$ | 50 | 35 | 85 |
|  | Total | 124 | 55 | 179 |

Calculate the expected frequencies $\left(E_{i}\right)$ for each cell. For example:
Expected frequency ' $\leqslant 30^{\prime}$ and $' \leqslant 3$ ' $=\frac{94 \times 124}{179}=65.117$
The expected frequencies $\left(E_{i}\right)$ are:

|  |  | Number of cards |  |
| :---: | :---: | :---: | :---: |
|  |  | $\leqslant \mathbf{3}$ | $>\mathbf{3}$ |
| Age | $\leqslant \mathbf{3 0}$ | 65.117 | 28.883 |
|  | $>\mathbf{3 0}$ | 58.883 | 26.117 |

The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{i}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 74 | 65.117 | 1.2118 |
| 20 | 28.883 | 2.7320 |
| 50 | 58.883 | 1.3491 |
| 35 | 26.117 | 3.0214 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=8.305$
The number of degrees of freedom $v=(2-1)(2-1)=1$; from the tables: $\chi_{1}^{2}(5 \%)=3.841$
As 8.305 is greater than 3.841 , reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is evidence of an association between the age and number of bank cards possessed.

## INTERNATIONAL A LEVEL

## Statistics 3

11 a $\mathrm{H}_{0}$ : There is no association between injury rate and choice of gym.
$\mathrm{H}_{1}$ : There is an association between injury rate and choice of gym.
b Calculate the expected value for each cell by multiplying column and row totals and dividing by the grand total:

$$
E_{C, I}=\frac{175 \times 34}{865}=6.88(2 \text { d.p. })
$$

c The test statistic $\left(X^{2}\right)$ calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{i}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 15 | 9.32 | 3.462 |
| 4 | 10.14 | 3.718 |
| 8 | 6.88 | 0.182 |
| 7 | 7.66 | 0.057 |
| 222 | 227.68 | 0.142 |
| 254 | 247.86 | 0.152 |
| 167 | 168.12 | 0.007 |
| 188 | 187.34 | 0.002 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=7.722$
The number of degrees of freedom $\boldsymbol{v}=(4-1)(2-1)=3$; from the tables: $\chi_{3}^{2}(5 \%)=7.815$
As 7.722 is less than 7.815 , there is insufficient evidence to reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is no reason to believe there is an association between injury rate and choice of gym.
$12 \mathbf{a} \mathrm{H}_{0}$ : There is no association between science studied and salary.
$\mathrm{H}_{1}$ : There is an association between science studied and salary.
b Calculate the expected value for each cell:

$$
E_{B, 0-20}=\frac{104 \times 9}{323}=2.90
$$

The expected frequencies $\left(E_{i}\right)$ are:

|  | Salary |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{£ 0} \mathbf{-} \mathbf{£ 2 0 k}$ | $\mathbf{£ 2 0 k} \mathbf{£ 4 0 k}$ | $\mathbf{£ 4 0} \mathbf{-} \mathbf{6 0 k}$ | $\mathbf{£ 6 0 k} \mathbf{£ 8 0 k}$ | $>\mathbf{£ 8 0 k}$ |
| Biology | 2.90 | 67.29 | 26.40 | 4.51 | 2.90 |
| Chemistry | 3.01 | 69.88 | 27.42 | 4.68 | 3.01 |
| Physics | 3.09 | 71.82 | 28.18 | 4.81 | 3.09 |

Require each cell of the expected table to have a value at least 5; merge the first two columns (so create a category $£ 0-£ 40 \mathrm{~K}$ ) and the last two columns (for a category $>£ 60 \mathrm{k}$ ).

|  | Salary |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{£ 0}-\mathbf{£ 4 0}$ | $\mathbf{£ 4 0 k} \mathbf{£ 6 0 k}$ | $>\mathbf{£ 6 0 k}$ |
| Biology | 70.19 | 26.40 | 7.41 |
| Chemistry | 72.89 | 27.42 | 7.69 |
| Physics | 74.92 | 28.18 | 7.90 |

The test statistic ( $X^{2}$ ) calculations are:

| $\boldsymbol{O}_{\boldsymbol{i}}$ | $\boldsymbol{E}_{\boldsymbol{i}}$ | $\frac{\left(\boldsymbol{O}_{\boldsymbol{i}}-\boldsymbol{E}_{\boldsymbol{i}}\right)^{2}}{\boldsymbol{E}_{\boldsymbol{i}}}$ |
| :---: | :---: | :---: |
| 73 | 70.19 | 0.7985 |
| 23 | 26.40 | 0.0560 |
| 8 | 7.41 | 0.5486 |
| 75 | 72.89 | 0.7049 |
| 27 | 27.42 | 0.2033 |
| 6 | 7.69 | 2.5344 |
| 70 | 74.92 | 0.0419 |
| 32 | 28.18 | 1.0664 |
| 9 | 7.90 | 2.6112 |

$X^{2}=\sum \frac{\left(O_{i}-E_{i}\right)^{2}}{E_{i}}=2.030$
The number of degrees of freedom $v=(3-1)(3-1)=4$; from the tables: $\chi_{4}^{2}(5 \%)=9.488$
As 2.030 is less than 9.488 , there is insufficient evidence to reject $\mathrm{H}_{0}$ at the $5 \%$ level. There is no reason to believe there is an association between science studied and salary.
