Sketching Graphs – Exponential and Trigonometric (Higher only)

Exponential functions

An exponential function is a function of the form

$$y = k^x$$

with k > 0.

As the name would suggest these functions increase 'exponentially'. This means they increase at an increasing rate. This can be seen in the graph on the right where the curve gets steeper over time.

Exponential functions are always positive since k is positive and a positive number raised to any power is also positive.

- If k > 1, the graph will show an increasing curve like the one shown above.
- If k = 1, the graph will be constant and equal to 1.
- If 0 < k < 1 the graph will be a decreasing curve which will get closer and closer to zero over time (but never reaches zero).

To sketch an exponential graph, begin by completing a table of values. The table displays the corresponding y value for chosen x values, found using the given exponential function.

Example: Sketch the graph of the function $y = 2^x$ between x = -2 and x = 4

1. Create the table of values for the values of *x*.

x	-2	-1	0	1	2	3	4
$y = 2^x$	0.25	0.5	1	2	4	8	16

2. Plot the values obtained as coordinates on a graph.

From the table above, we plot the coordinates

(-2, 0.25)
(-1, 0.5)
(0,1)
(1,2)
(2,4)
(3,8)
(4,16).

Then draw a smooth curve connecting these points.

Trigonometric Functions

The trigonometric functions are functions that take angles as their inputs and relate them to the ratio of the sides of a right-angled triangle. Sin, cosine and tan are trigonometric functions.

Trigonometric functions are **periodic**. This means they **repeat** their values after regular intervals. The length of the interval which repeats is called the **period**.

- Sine and cosine both have a period of 360°.
- Tan has a period of 180°.

When **sketching trigonometric graphs**, remember that the shape of the curve repeats infinitely in both directions. It is easy to sketch the trigonometric curves, as long as you remember the **identifying features** of each graph.

Sine

- $\sin x = 0$ at $x = 0^{\circ}$, 180° and 360°
- $\sin x = 1$ at $x = 90^{\circ}$
- $\sin x = -1$ at $x = 270^{\circ}$
- Repeats every 360°

Cosine

- $\cos x = 0$ at $x = 90^{\circ}$ and $x = 270^{\circ}$
- $\cos x = 1$ at $x = 0^{\circ}$ and $x = 360^{\circ}$
- $\cos x = -1$ at $x = 180^{\circ}$
- Repeats every 360°

Tan

- $\tan x = 0$ at $x = 0^{\circ}$, 180° and 360°
- tan x approaches infinity at odd multiples of 90° and then 'starts again' from minus infinity.
- Repeats every 180°

Exponential and Trigonometric Graphs (Higher) – Practice Questions

1. Sketch $y = 3^x$ between x = 0 and x = 3.

2. Sketch $y = \left(\frac{2}{3}\right)^x$ between x = -7 and x = 1.

3. Sketch $y = \tan x$ between $x = -270^{\circ}$ and $x = 270^{\circ}$.

4. Sketch $y = \cos(x + 90^\circ)$ between $x = -180^\circ$ and $x = 180^\circ$.

5. Sketch $y = -2\sin x + 1$ between $x = -90^{\circ}$ and $x = 180^{\circ}$.

Worked solutions for the practice questions can be found amongst the worked solutions for the corresponding worksheet file.
