Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
– *there may be more space than you need.*
- **Calculators may not be used.**
- Diagrams are **NOT** accurately drawn, unless otherwise indicated.
- You must **show all your working out.**

Information

- The total mark for this paper is 80
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Keep an eye on the time.
- Try to answer every question.
- Check your answers if you have time at the end.

Answer ALL questions.

Write your answers in the spaces provided.

You must write down all the stages in your working.

1 (a) Factorise $y^2 + 27y$

$$= y(y+27)$$

take out a common factor of y

$$y(y+27)$$

- 2 The diagram shows a square with perimeter 16 cm.

Work out the proportion of the area inside the square that is shaded.

total area of square $= 4 \times 4 = 16\text{ cm}^2$

area of Δ ① $\frac{1 \times 4}{2} = 2\text{ cm}^2$

area of Δ ② $\frac{2 \times 4}{2} = 4\text{ cm}^2$

shaded area $\text{total area} - \text{①} - \text{②}$
 $= 16 - 2 - 4 = 10\text{ cm}^2$

proportion shaded $= \frac{\text{shaded area}}{\text{total area}} = \frac{10}{16} = \frac{5}{8}$

$\frac{5}{8}$

- 3 David has designed a game.
He uses a fair 6-sided dice and a fair 5-sided spinner.
The dice is numbered 1 to 6
The spinner is numbered 1 to 5

Each player rolls the dice once and spins the spinner once.
A player can win £5 or win £2

total money in:
 $30 \times £1 = £30$

Win £5
 $P(\text{rolling } 5) = \frac{1}{6}$

David expects 30 people will play his game.
Each person will pay David £1 to play the game.

- (a) Work out how much profit David can expect to make.

$P(\text{spinning } 5) = \frac{1}{5}$
6 numbers on dice
5 numbers on spinner

so, $P(\text{winning } £5) = \frac{1}{6} \times \frac{1}{5} = \frac{1}{30}$
expecting 1 person to win £5.

Win £2

$\frac{1}{30} + \frac{4}{30} + \frac{5}{30} = \frac{10}{30}$
expect 10 people to win £2

money in = $5 + 10(2) = 25$

$30 - 25 = £5$ difference

- (b) Give a reason why David's actual profit may be different to the profit he expects to make.

the expected profit is calculated using probability, but the actual number of winners is down to chance.

- 4 Triangle ABC has perimeter 20 cm.

$$AB = 7 \text{ cm.}$$

$$BC = 4 \text{ cm.}$$

By calculation, deduce whether triangle ABC is a right-angled triangle.

$$\text{Side } CA = 20 - 7 - 4 = 9 \text{ cm.}$$

So, CA is the longest side.

If the triangle is right-angled, CA is the hypotenuse.

Pythagoras' theorem: $a^2 + b^2 = c^2$
 c being the hypotenuse

$$a^2 + b^2 = 7^2 + 4^2 = 49 + 16 = 65$$

$$c^2 = 9^2 = 81$$

$65 \neq 81$, so $\triangle ABC$ is not right-angled. (Total for Question 4 is 4 marks)

$$\frac{9}{4} \times \frac{10}{3} = \frac{90}{12} = \frac{45}{6} = \frac{15}{2} = 7\frac{1}{2}$$

Turn into a mixed fraction

$$7\frac{1}{2}$$

7 A shop has a sale.

Microwave ovens

$\frac{1}{3}$ off normal price

Combination ovens

40% off normal price

A microwave oven has a sale price of £90

A combination oven has a sale price of £84

Which of these ovens has the greater normal price?

You must show all your working.

Microwave [$\frac{1}{3}$ off, so $\frac{2}{3}$ remaining]

£90 is $\frac{2}{3}$ of normal price

£45 is $\frac{1}{3}$

£135 is $\frac{3}{3}$

£140 > £135, so the combination oven has the greater normal price.

Combination oven [40% off, so 60% left]

60% = £84
10% = £14
100% = £140

13 Mr Brown gives his class a test.

The 10 girls in the class get a mean mark of 70%

The 15 boys in the class get a mean mark of 80%

Nick says that because the mean of 70 and 80 is 75 then the mean mark for the whole class in the test is 75%

Nick is not correct.

Is the correct mean mark less than or greater than 75%?

You must justify your answer.

$$\text{total mark for girls} : 10 \times 70\% = 700\%$$

$$\text{total mark for boys} : 15 \times 80\% = 1200\%$$

$$\text{total mark for all students} : 1900\%$$

10+15=25, total students

$$\text{mean for class} = \frac{1900\%}{25} = 76\%$$

$$76\% > 75\%$$
