

London

$$11 = 108.9p$$

$$\begin{array}{ccc} \pounds 1 & = & \$1.66 \\ \downarrow \times 1.938 & & \downarrow \\ \pounds 1.938 & = & \$2.83 \end{array}$$

New York

$$1 \text{ US gallon} = \$2.83$$

$$1 \text{ US gallon} = 3.785L$$

$$3.785L = \$2.83$$

$$3.785L = \pounds 1.938 \checkmark$$

$$3.785L = 193.8p$$

$$(+3.785) (+3.785)$$

$$11 = 51.2p \checkmark$$

New York  $\checkmark$  because 11 of petrol in London costs 108.9p, whereas 11 in New York costs 51.2p

1. A gold bar has a mass of 12.5 kg.

The density of gold is 19.3 g/cm<sup>3</sup>

Work out the volume of the gold bar.

Give your answer correct to 3 significant figures.

$$\text{volume} = \frac{\text{mass}}{\text{density}}$$

$$\begin{array}{ccc} 1 \text{ kg} & = & 1000 \text{ g} \\ \downarrow \times 12.5 & & \downarrow \times 12.5 \\ 12.5 \text{ kg} & = & 12500 \text{ g} \end{array}$$

$$\text{Volume} = \frac{12500}{19.3}$$

$$= 647.67 \text{ cm}^3$$

$$= 648 \text{ cm}^3 \checkmark \checkmark$$

$$\dots\dots\dots 648 \checkmark \text{ cm}^3$$

(Total for Question is 3 marks)

- Draw the line  $y = -2$  onto the graph ①
- Find the  $x$  values of the 2 points at which the line  $y = -2$  and the curve  $y = x^2 - x - 6$  cross

$$y = x^2 - x - 6$$

$$-1.6 \text{ and } 2.6 \text{ ①}$$

2. A force of 70 newtons acts on an area of  $20 \text{ cm}^2$

The force is increased by 10 newtons.

The area is increased by  $10 \text{ cm}^2$

$\text{pressure} = \frac{\text{force}}{\text{area}}$
--

Helen says,

“The pressure decreases by less than 20%”

Is Helen correct?

You must show how you get your answer.

Initial Pressure:

$$P = \frac{F}{A} = \frac{70}{20} = 3.5 \text{ ①}$$

These values both have the same unit ( $\text{Ncm}^{-2}$ )

New Pressure:

$$P = \frac{F}{A} = \frac{70+10}{20+10} = \frac{80}{30} = 2.\dot{6}$$

20% less than the initial pressure = 80% of initial pressure

$$3.5 \times 0.8 = 2.8 \text{ ①}$$

80% of initial > new pressure

$$2.8 > 2.\dot{6} \text{ ①}$$

No, Helen is incorrect. The decrease is greater than 20%

3. Jackson is trying to find the **density, in  $\text{g/cm}^3$** , of a block of wood. The block of wood is in the shape of a **cuboid**.

He measures

the **length** as **13.2 cm**, correct to the nearest mm  
 the **width** as **16.0 cm**, correct to the nearest mm  
 the **height** as **21.7 cm**, correct to the nearest mm

He measures the **mass** as **1970 g**, correct to the nearest 5 g.

By considering **bounds**, work out the **density** of the wood. Give your answer to a suitable degree of accuracy.

You must show all your working and give a reason for your final answer.

$$m_u = 1972.5 \quad m_l = 1967.5 \quad \frac{5}{2} = 2.5\text{g} \quad \text{mass} = 1970 \pm 2.5\text{g}$$

$$V = l \times w \times h \quad V_u = l_u \times w_u \times h_u \quad \leftarrow \text{The product of larger numbers is a larger number}$$

	3SF	UB	LB
$l$	13.2	13.25	13.15
$w$	16.0	16.05	15.95
$h$	21.7	21.75	21.65

$$V_{UB} = 13.25 \times 16.05 \times 21.75 \\ = 4625.4\dots$$

$$V_{LB} = 4540.9\dots \quad (1)$$

$$d = \frac{m}{V}$$

$$d_u = \frac{m_u}{V_l} \quad \leftarrow \begin{array}{l} \text{greater numerator} \\ \text{lower denominator} \end{array} = \text{largest } d \text{ value}$$

$$d_l = \frac{m_l}{V_u}$$

$$d_u = \frac{1972.5}{4540.9\dots} = 0.4344\dots$$

$$d_l = \frac{1967.5}{4625.4\dots} = 0.4254\dots \quad (1)$$

$$0.43 \text{ g/cm}^3$$

Both the upper and lower bounds for density round to 0.43 to 2 dp. (1)

(Total for Question is 5 marks)

$$120 \times 5 = 600 \text{ minutes}$$

$$1 \text{ tap takes } 600 \text{ minutes}$$

$$600 \div 3 = 200 \text{ minutes}$$

..... 200

Each tap fills up pool at the same rate

4. A plane travels at a speed of 213 miles per hour.

(a) Work out an estimate for the number of seconds the plane takes to travel 1 mile.

$$213 \rightarrow 200$$

200 miles per 1 hour

200 miles per 60 minutes

200 miles per 3600 seconds

$$\downarrow \div 200$$

$$\downarrow \div 200$$

1 mile per 18 seconds

..... 18

..... seconds

(3)

(b) Is your answer to part (a) an underestimate or an overestimate?  
Give a reason for your answer.

Overestimate, because we rounded the speed down

(1)

(Total for Question is 4 marks)

5. In May 2019, the distance between Earth and Mars was  $3.9 \times 10^7$  km.

In May 2019, a signal was sent from Earth to Mars.

Assuming that the signal sent from Earth to Mars travelled at a speed of  $3 \times 10^5$  km per second,

- (a) how long did the signal take to get to Mars?

$$\text{Speed} = \frac{\text{distance}}{\text{time}} \quad \therefore \quad \text{time} = \frac{\text{distance}}{\text{speed}}$$

$$\text{time} = \frac{3.9 \times 10^7}{3 \times 10^5} \quad \therefore \quad \text{time} = \underline{\underline{130}} \text{ seconds}$$

①

①

130

seconds

(2)

The speed of the signal sent from Earth to Mars in May 2019 was actually less than  $3 \times 10^5$  km per second.

- (b) How will this affect your answer to part (a)?

The answer to part (a) will be bigger.

①

(1)

(Total for Question is 3 marks)

6. The density of ethanol is  $1.09 \text{ g/cm}^3$   
The density of propylene is  $0.97 \text{ g/cm}^3$

60 litres of ethanol are mixed with 128 litres of propylene to make 188 litres of antifreeze.

Work out the density of the antifreeze.

Give your answer correct to 2 decimal places.

$$\left. \begin{array}{l} 1 \text{ litre} = 1000 \text{ cm}^3 \\ \text{Density} = \frac{\text{mass}}{\text{volume}} \end{array} \right\} \begin{array}{l} 60 \text{ L of ethanol} = 60,000 \text{ cm}^3 \\ 128 \text{ L of propylene} = 128,000 \text{ cm}^3 \end{array}$$

Find mass of 60 L of ethanol:

$$\begin{aligned} \text{mass} &= \text{density} \times \text{volume} && \textcircled{1} \\ &= 1.09 \times 60,000 = 65,400 \text{ g} \end{aligned}$$

Find mass of 128 L of propylene:

$$\text{mass} = 0.97 \times 128,000 = 124,160 \text{ g} \quad \textcircled{1}$$

$\therefore$  total mass of antifreeze

$$= 65,400 + 124,160 = 189,560 \text{ g}$$

$\textcircled{1}$

$$\dots\dots\dots 1.01 \dots\dots\dots \text{ g/cm}^3$$

(Total for Question is 4 marks)

Density of antifreeze

$$= \frac{\text{mass of antifreeze}}{\text{volume of antifreeze}} = \frac{189,560}{188,000} \quad \textcircled{1}$$

$$= 1.00829787\dots \text{ g/cm}^3 \approx \underline{\underline{1.01 \text{ g/cm}^3}} \text{ (2 dp)}$$

7. The accurate scale drawing shows the positions of port  $P$  and a lighthouse  $L$ .

Scale: 1 cm represents 4 km.

Aleena sails her boat from port  $P$  on a bearing of  $070^\circ$ .  
 She sails for  $1\frac{1}{2}$  hours at an average speed of  $12\text{ km/h}$  to a port  $Q$ .

Find

- (i) the distance, in km, of port  $Q$  from lighthouse  $L$ ,
- (ii) the bearing of port  $Q$  from lighthouse  $L$ .

i) distance = speed  $\times$  time

distance =  $12 \times 1.5 = 18\text{ km}$

$1\text{ cm} : 4\text{ km}$   
 $\times 4.5 \downarrow$   $4.5\text{ cm} : 18\text{ km}$   $\uparrow \times 4.5$

$1\text{ cm} : 4\text{ km}$   
 $\times 5.5 \downarrow$   $5.5\text{ cm} : 22\text{ km}$   $\uparrow \times 5.5$

ii) bearing of port  $Q$  from lighthouse  $L$

$180^\circ + 140^\circ = 320^\circ$

distance  $QL = 22$  km

bearing of  $Q$  from  $L = 320^\circ$

8. A car travels for 18 minutes at an average speed of 72 km/h.

(a) How far will the car travel in these 18 minutes?

distance = speed  $\times$  time <sup>①</sup>

$$\begin{array}{l} \div 60 \left\{ \begin{array}{l} 60 \text{ minutes} = 1 \text{ hour} \\ 1 \text{ minute} = \frac{1}{60} \text{ hours} \end{array} \right. \div 60 \\ \times 18 \left\{ \begin{array}{l} 18 \text{ minutes} = \frac{18}{60} \text{ hours} \end{array} \right. \times 18 \end{array}$$

Need to be working in same units so converting 18 minutes to hours

$$\begin{aligned} \text{distance} &= 72 \times \frac{18}{60} \\ &= 72 \times \frac{9}{30} \\ &= 72 \times \frac{3}{10} \quad \begin{array}{r} 72 \\ \times 3 \\ \hline 216 \end{array} \\ &= \frac{72 \times 3}{10} = \frac{216}{10} = 21.6 \text{ km} \\ &\quad \quad \quad \underline{21.6} \text{ km} \quad \text{①} \\ &\quad \quad \quad (2) \end{aligned}$$

David says,

“72 kilometres per hour is faster than 20 metres per second.”

(b) Is David correct?

You must show how you get your answer.

Convert 72 km/h to m/s

$$\frac{\text{km}}{\text{h}} \rightarrow \frac{\text{m}}{\text{s}} \quad \left\{ \begin{array}{l} \times \frac{1000}{60 \times 60} = \frac{10}{6 \times 6} = \frac{10}{36} = \frac{5}{18} \end{array} \right.$$

$\times 1000$  gets from m to km

$\times 60 \times 60$  gets from s to h

To convert from km/h to m/s need to  $\times \frac{5}{18}$

$$72 \times \frac{5}{18} = \frac{72 \times 5}{18} = \frac{360}{18} = 20 \text{ m/s} \quad (2)$$

No because 72 km/h = 20 m/s

1 cm = 10 mm

$1^3 \text{ cm}^3 = 10^3 \text{ mm}^3$

$1 \text{ cm}^3 = 1000 \text{ mm}^3$

$1 \text{ cm}^3 = 1000 \text{ mm}^3$

$1 \text{ cm}^3 = 1000 \text{ mm}^3$

$1 \text{ cm}^3 = 1000 \text{ mm}^3$

$37 \text{ cm}^3 = 37000 \text{ mm}^3$

37000

9. Nimer was driving to a hotel.  
He looked at his Sat Nav at 13 30

Time	13 30
Distance to destination	65 miles

Nimer arrived at the hotel at 14 48

Work out the average speed of the car from 13 30 to 14 48  
You must show all your working.

Between 13:30

18 there is 1 hour 18 minutes

Convert everything to h

1 hour 18 minutes  $\rightarrow 1 \text{ hour} + \frac{18}{60} \text{ hours} \rightarrow 1 + \frac{18}{60} \text{ hours} \rightarrow 1.3 \text{ hours}$

Speed =  $\frac{\text{distance}}{\text{time}}$

Speed =  $\frac{65}{1.3} = 50 \text{ mph}$

50 mph

10. Liquid A and liquid B are mixed together in the ratio 2:13 by volume to make liquid C.

Liquid A has density  $1.21 \text{ g/cm}^3$

Liquid B has density  $1.02 \text{ g/cm}^3$

A cylindrical container is filled completely with liquid C.

The cylinder has radius 3 cm and height 25 cm.

Work out the mass of the liquid in the container.

Give your answer correct to 3 significant figures.

You must show all your working.

$$\text{Volume cylinder} = \pi r^2 h$$

↖ height  
↙ radius ①

$$\text{Volume cylinder} = \pi(3)^2 25 = 225\pi \text{ cm}^3$$

$2 + 13 = 15$ $\frac{225\pi}{15} = 15\pi$ $2 \times 15\pi : 13 \times 15\pi$ $30\pi : 195\pi$
---

split into ratio 2:13

∴ Within cylinder we have

$30\pi \text{ cm}^3$  of liquid A ①

$195\pi \text{ cm}^3$  of liquid B

$$\text{density} = \frac{\text{mass}}{\text{volume}} \text{ so } \text{mass} = \text{density} \times \text{volume}$$

In the cylinder → liquid A, liquid B

$$\begin{aligned} \text{Mass} &= 1.21 \times 30\pi \\ &= 36.3\pi \text{ g} \end{aligned}$$

$$\begin{aligned} \text{Mass} &= 1.02 \times 195\pi \\ &= 198.9\pi \text{ g} \end{aligned}$$

Therefore mass of container ①

$$36.3\pi + 198.9\pi = 235.2\pi \text{ g} = 738.90259\dots = 739 \text{ g (3sf)} \quad 739 \text{ g} \quad ①$$

11. The diagram shows a prism placed on a horizontal floor.

$$\text{pressure} = \frac{\text{force}}{\text{area}}$$

The prism has height 3 m  
 The volume of the prism is  $18 \text{ m}^3$

The pressure on the floor due to the prism is  $75 \text{ newtons/m}^2$

Work out the force exerted by the prism on the floor.

A diagram of the prism with its base shaded in purple. An arrow points from the shaded base to the text 'cross-sectional area'. To the right, the formula  $\text{pressure} = \frac{\text{force}}{\text{cross-sectional area}}$  is written in purple.

Work out cross-sectional area:

$$\text{cross-sectional area} = \frac{\text{volume}}{\text{height}} = \frac{18}{3} = 6 \text{ m}^2$$

Work out force:

..... 450 ..... newtons

(Total for Question is 3 marks)

$$\text{pressure} = \frac{\text{force}}{\text{cross-sectional area}}$$

$$75 = \frac{\text{force}}{6}$$

$$\therefore \text{force} = 75 \times 6 = \underline{\underline{450 \text{ N}}}$$

12. Liquid A and liquid B are mixed to make liquid C.

Liquid A has a density of  $70 \text{ kg/m}^3$

Liquid A has a mass of  $1400 \text{ kg}$

Liquid B has a density of  $280 \text{ kg/m}^3$

Liquid B has a volume of  $30 \text{ m}^3$

Work out the density of liquid C.

$$\text{density} = \frac{\text{mass}}{\text{Volume}}$$

$$\begin{array}{r} 196 \\ 5 \overline{) 980} \\ \underline{50} \phantom{0} \\ 48 \phantom{0} \\ \underline{45} \phantom{0} \\ 30 \\ \underline{30} \\ 0 \end{array}$$

$$\text{Vol. Liquid A} \rightarrow \text{Vol} = \frac{\text{mass}}{\text{density}} = \frac{1400 \text{ kg}}{70 \text{ kgm}^{-3}} = 20 \text{ m}^3 \quad \checkmark$$

$$\text{mass. Liquid B} \rightarrow \text{mass} = \text{density} \times \text{Vol} = 280 \text{ kgm}^{-3} \times 30 \text{ m}^3 = 8400 \text{ kg}$$

$$\text{Mass. Liquid C} = 1400 \text{ kg} + 8400 \text{ kg} = 9800 \text{ kg}$$

$$\text{Vol. Liquid C} = 20 \text{ m}^3 + 30 \text{ m}^3 = 50 \text{ m}^3$$

$$\text{density. Liquid C} = \frac{9800 \text{ kg} \checkmark}{50 \text{ m}^3} = 196 \text{ kg m}^{-3}$$

$$\dots 196 \checkmark \dots \text{ kg/m}^3$$
