## **Section B**

Answer all the questions in the spaces provided.

The time allowed is 1 hour 15 minutes.

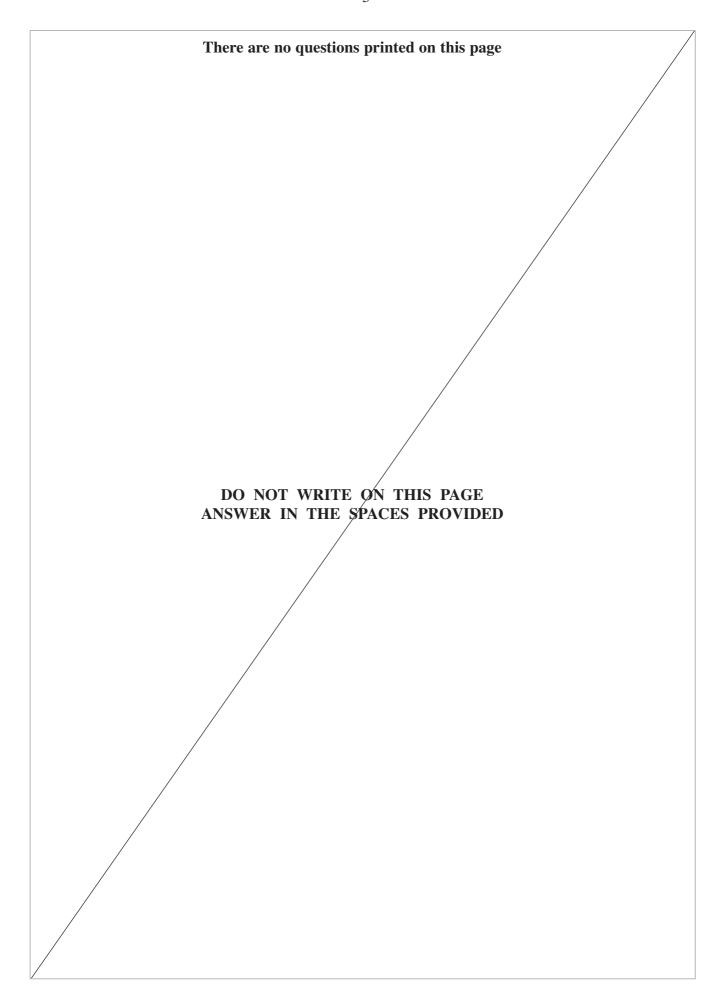

You will need to refer to the work you did in Section A Part 2 when answering these questions.

1	(a)	(i)	Determine the gradient, $G$ , of your graph of $ln(V/mV)$ against $Q$ .
			$G = \dots$
1	(a)	(ii)	Read and record the vertical intercept from your graph.
•	( <b>u</b> )	(11)	
			vertical intercept =(3 marks)
1	(b)	abso by d	udent claims that an analogy can be made between the experiment in which light is orbed by the ink solution and an experiment in which ionising radiation is absorbed different thicknesses of metal plates.  In the analogy, she suggests that the output voltage of the solar cell, $V$ , is given by
			$V = Pe^{-\lambda Q},$
		whe	re $P$ and $\lambda$ are constants.
1	(b)	(i)	If the student's analogy is correct, describe the form that a graph of $\ln(V/\text{mV})$ against $Q$ should take and explain how the values of $P$ and $\lambda$ may be deduced from the graph.

1 (b)	Explain whether the qualitative and quantitative evidence obtained from your graph confirms the student's analogy.

2	(a)	(i)	Describe <b>one</b> difficulty you experienced when measuring the volume of the ink solution.
2	(a)	(ii)	Explain <b>one</b> precaution you took to reduce the uncertainty when measuring the volume of ink solution in the measuring cylinders.  You may wish to use a sketch to illustrate your answer.
			(2 marks)
2	(b)	and	ing transferred between 90ml and 100 ml of ink solution to the beaker, students A B did not follow the instructions about which measuring cylinders they should use.
		Stud Stud	lent A used only the <b>larger</b> measuring cylinder (capacity 100 ml, 1 ml graduations). lent B used only the <b>smaller</b> measuring cylinder (capacity 25 ml, 0.5 ml luations).
2	(b)	(i)	Give a disadvantage of the procedure followed by student A.
2	<b>(b)</b>	(ii)	Give a disadvantage of the procedure followed by student B.
			(2 marks)

4

3 A student adapts the experiment to investigate how light is absorbed by glass. The student uses a varying number of glass microscope slides (up to a maximum of 20 slides) placed in a single stack on top of the solar cell to produce different thicknesses of the glass.

The student plots a graph of his results, as shown in **Figure 5**. Note that N = number of glass microscope slides placed on top of the solar cell.

Assuming that the output voltage of the solar cell is directly proportional to the light intensity incident upon it, the student intends to determine the half-value thickness of glass, ie the thickness of glass that would reduce the output voltage by half.

3	(a)	Use the information provided in the student's graph to calculate $N_{0.5}$ , the value of $N$ equivalent to the half-value thickness of the glass.							
		(3 marks)							

3	(b)	To determine the half-value thickness of the glass in mm, the student needs to make one additional measurement.		
3	(b)	<b>(i)</b>	Identify the measurement the student needs to make and explain how this is used to determine the half-value thickness of the glass.	
3	<b>(b)</b>	(ii)	The student uses a micrometer screw gauge to make the additional measurement.  Identify <b>one</b> procedure that can be used to reduce the effect of random errors	
3	(6)	(11)	when making the measurement.	
3	(b)	(iii)	Identify <b>one</b> procedure that can be used to detect, and hence correct, for possible systematic errors in the measurements made with the micrometer screw gauge.	
			(3 marks)	

4 The student uses a travelling microscope to learn more about the properties of the glass slides.

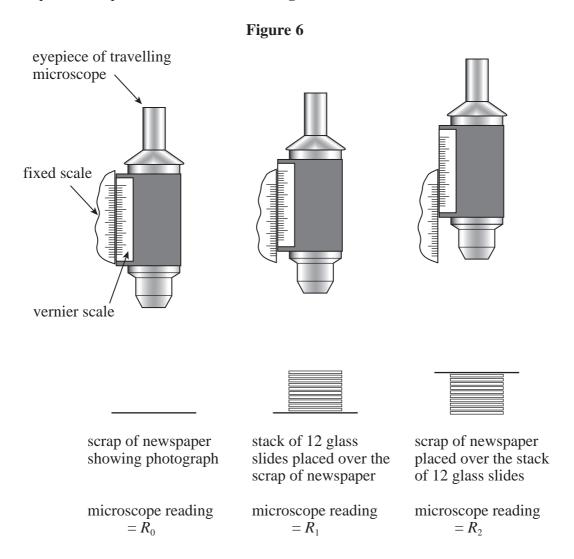

The eyepiece of the microscope is arranged to move vertically up or down above a scrap of newspaper showing a photograph.

The photograph is composed of dots which are only clearly visible when viewed through the microscope. By adjusting the position of the microscope the student brings the dots into focus and then reads the position of the microscope,  $R_0$ , using the vernier scale.

The student then places a stack of 12 slides over the photograph and refocuses the microscope. She records the new reading,  $R_1$ .

Finally, she places the photograph on top of the slides, refocuses the microscope, and records the new reading  $R_2$ .

The sequence of operations is illustrated in **Figure 6**.

The readings made by the student are shown in the table below.

$R_0$ / mm	$R_1$ / mm	$R_2$ /mm		
2.74	7.31	17.02		

4	(a)	Assuming that the slides have identical dimensions, use the readings to determine the thickness of one glass microscope slide.		
		•••••		
		•••••	(1 mark)	
4	(b)	Dete	rmine $n$ , the refractive index of the glass, given by $n = \frac{R_2 - R_0}{R_2 - R_1}$ .	
			(1 mark)	
4	(c)	The	uncertainty in each of the readings $R_0$ , $R_1$ and $R_2$ , is 0.04 mm.	
4	(c)	(i)	State the uncertainty in $R_2 - R_0$ .	
4	(c)	(ii)	State the uncertainty in $R_2 - R_1$ .	
4	(c)	(iii)	Hence calculate the percentage uncertainty in $n$ .	
			(3 marks)	

END OF SECTION B
