## PHYSICS

9702/32

Paper 3 Advanced Practical Skills 2

May/June 2024

2 hours

You must answer on the question paper.

You will need: The materials and apparatus listed in the confidential instructions

## INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You will be allowed to work with the apparatus for a maximum of 1 hour for each question.
- You should record all your observations in the spaces provided in the question paper as soon as these observations are made.
- You may use a calculator.
- You should show all your working and use appropriate units.

## INFORMATION

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [ ].

### For Examiner's Use

This document has **12** pages. Any blank pages are indicated.

**BLANK PAGE**

**You may not need to use all of the materials provided.**

**1** In this experiment, you will investigate an electrical circuit.

**(a)** • Connect the circuit shown in Fig. 1.1.

**Fig. 1.1**

- **Ensure that the polarities of the power supply, component C and the voltmeter are as shown in Fig. 1.1.**
- Close switch S for a short time and then open it.
- Watch the voltmeter reading as it reduces.

When the voltmeter reading passes a value  $V_S$  of 8.00 V, start the stop-watch.

When the voltmeter reading passes a value of 7.00 V, stop the stop-watch.

- Record the starting value  $V_S$  and the time  $T$  for the voltmeter reading to fall by 1.00 V.

$V_S =$  .....

$T =$  .....  
[2]

4

- (b) Choose another starting value  $V_S$ . Close S for a short time and then open it. Measure the time  $T$  for the voltmeter reading to fall by 1.00 V from the starting value  $V_S$ .

Repeat until you have six sets of values of  $V_S$  and  $T$ .

Record your results in a table. Include values of  $\frac{1}{T}$  in your table.

[10]

- (c) (i) Plot a graph of  $\frac{1}{T}$  on the  $y$ -axis against  $V_S$  on the  $x$ -axis. [3]

- (ii) Draw the straight line of best fit. [1]

- (iii) Determine the gradient and  $y$ -intercept of this line.

gradient = .....

$y$ -intercept = .....

[2]

6

(d) It is suggested that the quantities  $V_S$  and  $T$  are related by the equation

$$\frac{1}{T} = aV_S + b$$

where  $a$  and  $b$  are constants.

Using your answers in (c)(iii), determine the values of  $a$  and  $b$ .  
Give appropriate units.

$a =$  .....

$b =$  .....

[2]

[Total: 20]

**You may not need to use all of the materials provided.**

**2** In this experiment, you will investigate the equilibrium of a wooden rod.

- (a) (i)**
- Assemble the apparatus as shown in Fig. 2.1.
  - Adjust the apparatus so that the wooden rod is parallel to the bench and the spring is vertical.

**Fig. 2.1** (not to scale)

- The distance between the ends of the spring is  $L_0$ , as shown in Fig. 2.1.  
Measure and record  $L_0$ .

$L_0 = \dots\dots\dots$  m [1]

8

- (ii) • Pull the mass hanger down a short distance and then release it. The mass hanger will oscillate.
- Take measurements to find the period  $T$  of the oscillations.

$T = \dots\dots\dots$  [2]

- (iii) • Calculate the value of the spring constant  $k$  using

$$k = \frac{\alpha\pi^2}{T^2}$$

where  $\alpha = 0.800$  kg.

$k = \dots\dots\dots \text{Nm}^{-1}$

- Justify the number of significant figures that you have given for your value of  $k$ .

.....

.....

.....

[1]

- (b) (i) • Move the stand supporting the spring away from the other stand and add the plumb line, as shown in Fig. 2.2.

**Fig. 2.2** (not to scale)

- Adjust the apparatus so that the angle  $\theta$  between the spring and the vertical is approximately  $20^\circ$  and the wooden rod is parallel to the bench, as shown in Fig. 2.2.
- The new distance between the ends of the spring is  $L$ , as shown in Fig. 2.2.

Measure and record  $L$ .

$L = \dots\dots\dots$  m

- Measure and record  $\theta$ .

$\theta = \dots\dots\dots^\circ$   
[2]

- (ii) Estimate the percentage uncertainty in your value of  $\theta$ . Show your working.

percentage uncertainty =  $\dots\dots\dots\%$  [1]

(iii) Repeat (b)(i) using an angle  $\theta$  of approximately  $45^\circ$ .

$L = \dots\dots\dots$  m

$\theta = \dots\dots\dots^\circ$   
[3]

(c) It is suggested that the relationship between  $L$  and  $\theta$  is

$$k(L - L_0) + B = \frac{D}{\cos \theta}$$

where  $B = 2.0\text{ N}$  and  $D$  is a constant.

Using your data, calculate two values of  $D$ .

first value of  $D = \dots\dots\dots$

second value of  $D = \dots\dots\dots$   
[1]

(d) It is suggested that the percentage uncertainty in the values of  $D$  is 10%.

Using this uncertainty, explain whether your results support the relationship in (c).

.....  
.....  
.....  
..... [1]

- (e) (i) Describe **four** sources of uncertainty or limitations of the procedure for this experiment.

For any uncertainties in measurement that you describe, you should state the quantity being measured and a reason for the uncertainty.

1 .....

.....

2 .....

.....

3 .....

.....

4 .....

.....

[4]

- (ii) Describe **four** improvements that could be made to this experiment. You may suggest the use of other apparatus or different procedures.

1 .....

.....

2 .....

.....

3 .....

.....

4 .....

.....

[4]
