**Unit 2: Physics at Work**

**You do not need any other materials.**

Total Marks

## Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – *there may be more space than you need.*

## Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
  – *use this as a guide as to how much time to spend on each question.*
- Questions labelled with an **asterisk** (**\***) are ones where the quality of your written communication will be assessed
  – *you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.*
- The list of data, formulae and relationships is printed at the end of this booklet.
- Candidates may use a scientific calculator.

## Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

*Turn over* ▶

**Pearson**

## SECTION A

### Answer ALL questions.

**For questions 1–10, in Section A, select one answer from A to D and put a cross in the box ☒.
If you change your mind, put a line through the box ☒ and then
mark your new answer with a cross ☒.**

1   Which of the following graphs shows how current $I$ varies with potential difference $V$ for
a negative temperature coefficient thermistor?

☒  **A**

☒  **B**

☒  **C**

☒  **D**
**(Total for Question 1 = 1 mark)**

2   Which of the following processes makes use of microwaves?

☒  **A**  connecting a mobile phone network

☒  **B**  imaging a broken bone within a human body

☒  **C**  sterilising hospital equipment

☒  **D**  testing a person's eyesight for short sight

**(Total for Question 2 = 1 mark)**

**3** The diagram shows waves passing along a section of a spring at a particular time.

Which of the following graphs of displacement against distance along this section of the spring, at this particular time, is correct?

☒ **A**

☒ **B**

☒ **C**

☒ **D**

**(Total for Question 3 = 1 mark)**

*Turn over* ▶

**4** A standing wave is set up on a string of length $l$ as shown.

Which of the following gives the wavelength $\lambda$ of the waves on the string?

☒ **A** $\lambda = \dfrac{l}{3}$

☒ **B** $\lambda = \dfrac{2l}{3}$

☒ **C** $\lambda = \dfrac{3l}{2}$

☒ **D** $\lambda = 3l$

**(Total for Question 4 = 1 mark)**

**5** Light from a lamp passes through two polarising filters, P1 and P2, before reaching a detector. Each filter can be rotated through an angle as shown.

The filters initially have their planes of polarisation perpendicular to each other.

The intensity of light at the detector will be greatest if

☒ **A** P1 is rotated by 45° and P2 is rotated by 315° in the same direction.

☒ **B** P1 is rotated by 90° and P2 is rotated by 270° in the same direction.

☒ **C** P1 is rotated by 45° and P2 is rotated by 270° in the same direction.

☒ **D** P1 is rotated by 90° and P2 is rotated by 315° in the same direction.

**(Total for Question 5 = 1 mark)**

**6** A beam of electrons is directed at a graphite crystal. After passing through the crystal, the beam is incident on a fluorescent screen where each incident electron produces light. The photograph shows the pattern observed on the screen.

Which of the following gives two properties of electrons which help to explain the production of this pattern?

☒ **A** diffraction and refraction

☒ **B** diffraction and superposition

☒ **C** polarisation and refraction

☒ **D** polarisation and superposition

**(Total for Question 6 = 1 mark)**

**7** The following circuit contains two resistors of equal resistance and a diode.

What is the reading on the digital voltmeter?

☒ **A** 0 V

☒ **B** 0.7 V

☒ **C** 1.5 V

☒ **D** 3.0 V

**(Total for Question 7 = 1 mark)**

**8** A conductor of cross-sectional area *A* carries a current *I*. The speed of the charge carriers is *v*.

A second conductor, made of the same material, has a cross-sectional area 2*A* and carries a current 2*I*.

What is the speed of the charge carriers in the second conductor?

☒ **A** $\dfrac{v}{4}$

☒ **B** *v*

☒ **C** 2*v*

☒ **D** 4*v*

**(Total for Question 8 = 1 mark)**

**9** Which of the following are the base units for the Planck constant?

☒ **A** $kg\ m\ s^{-2}$

☒ **B** $kg\ m^2\ s^{-1}$

☒ **C** $kg\ m^2\ s^{-2}$

☒ **D** $kg\ m^2\ s^{-3}$

**(Total for Question 9 = 1 mark)**

**10** A teacher is talking to a student outside a classroom. Although they are out of sight from the rest of the class the door is left open. The rest of the class can hear the conversation between the teacher and the student clearly.

○ student

○ teacher

class
Which of the following properties of waves explains this?

☒ **A** diffraction

☒ **B** polarisation

☒ **C** refraction

☒ **D** superposition

**(Total for Question 10 = 1 mark)**

**TOTAL FOR SECTION A = 10 MARKS**

**SECTION B**

**Answer ALL questions in the spaces provided.**

**11** Wire wound resistors are made by coiling a length of wire around a ceramic core and then coating the arrangement in a protective sealant as shown.

wire around ceramic core                  protective sealant
(a) Show that the resistance of a 1.40 m length of nichrome wire of diameter 0.0500 mm is about 1100 Ω.

resistivity of nichrome = $1.50 \times 10^{-6}$ Ω m

**(3)**

.............................................................................................................................................................................

.............................................................................................................................................................................

.............................................................................................................................................................................

.............................................................................................................................................................................

(b) A wire wound resistor is required with a value of resistance as close as possible to 1100 Ω. This can be achieved by using a nichrome wire with any value of diameter and then cutting the corresponding length of wire.

Explain how a greater accuracy of resistance value could be obtained using a different combination of length and diameter from those given in (a).

**(2)**

**(Total for Question 12 = 6 marks)**

P 5 1 6 0 5 A 0 9 2 8

**13** The efficiency of different types of solar panel used to generate electricity varies widely. A solar panel was connected to a resistor and placed in sunlight. The following data was collected:

radiation flux of sunlight = 800 W m$^{-2}$
potential difference across resistor = 29 V
current through resistor = 7.3 A
dimensions of solar panel = 1.6 m × 0.95 m

(a) Calculate the efficiency of the solar panel when transferring light energy to electrical energy in this resistor.

(4)

.......................................................................................................................................................................

.......................................................................................................................................................................

.......................................................................................................................................................................

(images taken from http://spiff.rit.edu/classes/phys301/lectures/doppler/doppler.html#rotgal)

**BLANK PAGE**

16 Driverless cars are fitted with sensors to "map out" their surroundings so that they can navigate. A transducer on the car emits a pulse of laser light. The laser light is reflected from nearby objects and is received by the transducer.

(a) State the factors that determine the fraction of the laser light which is reflected from a nearby object and received by the transducer.

(3)

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

(b) The duration of the pulse of laser light is 5.0 ns.

Determine whether this allows objects as close as 1.0 m from the car to be detected.

(3)

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

...........................................................................................................................................................

(c) Ultrasound would also be reflected from the objects around the car.
However, ultrasound travels at a much slower speed than laser light.

Suggest why the laser light could not be replaced with ultrasound in a driverless car.

(2)

**(Total for Question 16 = 8 marks)**

P 5 1 6 0 5 A 0 1 7 2 8

**17** A liquid level sensor uses a plastic prism, a light source and a receiver.

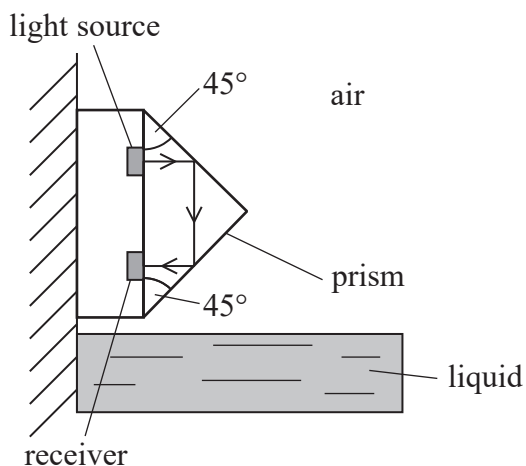

When the liquid is below the level of the prism the light totally internally reflects to the receiver as shown.

(a) Describe the conditions required for total internal reflection.

(2)

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

(b) The critical angle for light travelling from plastic to air is 42°.
Explain why the light reaches the receiver.

(3)

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

....................................................................................................................................................................

(c) When the liquid surrounds most of the prism the light does not reach the receiver.

(i) Calculate the critical angle for light travelling from the plastic prism into the liquid.

velocity of light in plastic = $2.0 \times 10^8$ m s$^{-1}$
velocity of light in liquid = $2.3 \times 10^8$ m s$^{-1}$

**(3)**
