**Pearson Edexcel Level 3 GCE**

Time 2 hours 30 minutes

Paper reference **9PH0/03**

**Physics**

**Advanced**

**PAPER 3: General and Practical Principles in Physics**

**You must have:**  
Scientific calculator, ruler

Total Marks

## Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*

## Information

- The total mark for this paper is 120.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*
- In questions marked with an **asterisk** (\*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.
- The list of data, formulae and relationships is printed at the end of this booklet.

## Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- You are advised to show your working in calculations including units where appropriate.

Q:1/1/1/1/

Pearson

**Answer ALL questions in the spaces provided.**

- 1 A student investigated the behaviour of a spring under tension. The spring was hung vertically with a mass holder attached, as shown. The position of the bottom of the mass holder was determined using a metre rule.

- (a) The position of the bottom of the mass holder was recorded. The spring was stretched by adding masses to the mass holder and the new positions were determined. The extension of the spring for each mass was calculated.

The results are shown in the table.

Mass/kg	Extension/m
0.05	0.019
0.10	0.042
0.15	0.058
0.20	0.085
0.25	0.1
0.35	0.14

Criticise the recording of these results.

(2)

.....

.....

.....

.....

(b) Describe how the student should determine the extension of the spring as accurately as possible.

(3)

2 A student was given a box of identical glass microscope slides and asked to determine the density of the glass. She used a micrometer to measure the thickness of one of the slides. She repeated this measurement twice in different places and calculated a mean value for the thickness. The thickness of each slide was approximately 1 mm.

(a) Explain how she should have measured the thickness of the slides in order to minimise the percentage uncertainty.

(2)

.....

.....

.....

(b) In her report she wrote

*"My value for the mass of the glass slides was precise, because I measured the mass using an electronic balance which was accurate to the nearest 0.01g. I reduced the effect of random error by repeating the measurement several times."*

Comment on this statement.

**(Total for Question 2 = 6 marks)**

- 3 It was suggested on an online forum that it would be possible to cook a chicken by repeatedly slapping the chicken with one hand.

It was claimed that the energy transferred to a chicken in 8000 slaps would be sufficient to raise the temperature of the chicken from  $23\text{ }^{\circ}\text{C}$  to  $165\text{ }^{\circ}\text{C}$ .

In an investigation to test the claim, the effective mass of the hand was taken as  $1.75\text{ kg}$  and the speed of the hand just before impact with the chicken as  $6.25\text{ m s}^{-1}$ .

- (a) Deduce whether the data confirms that 8000 slaps would be sufficient.  
Assume that no energy is transferred from the chicken to the surroundings.

mass of chicken =  $0.875\text{ kg}$

specific heat capacity of chicken =  $1770\text{ J kg}^{-1}\text{ K}^{-1}$

efficiency of energy transfer from the hand =  $65\%$

(5)

- (b) Explain whether the assumption made in (a) is realistic.

- \*5 The diagram shows a 'shaker torch'. When the torch is shaken, a strong magnet moves forwards and backwards through a copper coil, powering a light-emitting diode (LED).

Each time the magnet moves through the coil a current pulse is generated. The coil is connected to a capacitor via a diode, as shown.

Once the torch has been shaken for a few minutes the switch is closed and the LED lights for a short while.

- 6 In an experiment to determine the speed of sound in air a student connected two microphones to an oscilloscope, as shown.

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

The microphones detect sound from the loudspeaker, converting it to an electrical signal. The signal is displayed on the oscilloscope screen.

Both microphones were initially positioned the same distance from the loudspeaker. The two signals were in phase on the oscilloscope screen. The student slowly moved microphone 2 towards the loudspeaker, until the two signals on the oscilloscope were in phase again. He then measured the distance  $d$  between the microphones to determine the wavelength  $\lambda$  of the sound waves.

$$d = 20.5 \text{ cm}$$

- (a) Comment on the student's experimental technique to determine  $\lambda$ .

(2)

.....

.....

.....

.....

.....

(b) The oscilloscope trace for the signal from microphone 1 is shown below.

The time base of the oscilloscope was set to  $0.20 \text{ ms div}^{-1}$ .

Determine a value for the speed of sound in air.

(5)

Speed of sound = .....

(Total for Question 11 = 14 marks)

12 In 2011, a tsunami was caused by a massive earthquake centred some distance off the coast of Japan. The tsunami caused a cooling system failure at the Fukushima Nuclear Power Plant. This resulted in a nuclear meltdown and radioactive materials were released into the surroundings.

- (a) A reservoir beside one of the reactor buildings contained a large volume of water. In 2013, this water was found to have an extremely high concentration of caesium-137.

Caesium-137 is a radioactive isotope of caesium.

- (i) Complete the nuclear equation for the decay of caesium-137.

- (ii) An activity of  $2.35 \times 10^{12}$  Bq per  $\text{m}^3$  of water in the reservoir was measured. It is suggested that a safe level for the activity of all water in the reservoir would be 100 Bq.

Calculate the time in years for the caesium-137 to decay to a safe level.

volume of water in reservoir =  $5000 \text{ m}^3$

half-life of caesium-137 = 30 years

(4)

Time = ..... years

- 13 A student used a sonometer to investigate the properties of a stretched wire. The sonometer is a long hollow wooden box.

A steel wire is attached to one end of the box and rests on two wooden bridges. The wire is placed under tension  $T$  by hanging a mass from the end of the wire, as shown.

The student placed the base of a vibrating tuning fork in contact with the wire, at one of the bridges. This set the wire into oscillation. He adjusted the position of the other bridge until a single-loop standing wave was produced on the wire between the bridges.

- (a) Explain how an antinode is produced at the mid-point of the wire between the bridges.

(3)

.....

.....

.....

.....

.....

.....

- (b) The student repeated this for a series of tuning forks with different frequencies  $f$ . For each fork he measured the distance  $L$  between the bridges.

The steel wire, of mass per unit length  $\mu$ , was placed under tension  $T$  by hanging a mass of 2.10 kg from the end of the wire.

- (i) State one safety precaution that should be taken when carrying out the investigation.

(1)

- (ii) The student plotted a graph of  $L^2$  against  $1/f^2$ .

Show that the gradient of this graph is equal to  $\frac{T}{4\mu}$

(3)

(iii) The student's graph is shown below.

The value of  $\mu$  for different standard wire gauge (SWG) steel wire is shown in the table.

SWG	$\mu/\text{gm}^{-1}$
22	3.15
24	1.95
26	1.31

Deduce which wire the student used in the investigation.

(4)
