## GCE A LEVEL MARKING SCHEME

AUTUMN 2021

A LEVEL
PHYSICS - COMPONENT 2
A420U20-1

## INTRODUCTION

This marking scheme was used by WJEC for the 2021 examination. It was finalised after detailed discussion at examiners' conferences by all the examiners involved in the assessment. The conference was held shortly after the paper was taken so that reference could be made to the full range of candidates' responses, with photocopied scripts forming the basis of discussion. The aim of the conference was to ensure that the marking scheme was interpreted and applied in the same way by all examiners.

It is hoped that this information will be of assistance to centres but it is recognised at the same time that, without the benefit of participation in the examiners' conference, teachers may have different views on certain matters of detail or interpretation.

WJEC regrets that it cannot enter into any discussion or correspondence about this marking scheme.

## GCE A LEVEL COMPONENT 2 - ELECTRICITY AND THE UNIVERSE

## AUTUMN 2021 MARK SCHEME

## GENERAL INSTRUCTIONS

## Recording of marks

Examiners must mark in red ink.
One tick must equate to one mark (except for the extended response question).
Question totals should be written in the box at the end of the question.
Question totals should be entered onto the grid on the front cover and these should be added to give the script total for each candidate.

## Marking rules

All work should be seen to have been marked.
Marking schemes will indicate when explicit working is deemed to be a necessary part of a correct answer.
Crossed out responses not replaced should be marked
Credit will be given for correct and relevant alternative responses which are not recorded in the mark scheme.

Extended response question
A level of response mark scheme is used. Before applying the mark scheme please read through the whole answer from start to finish. Firstly, decide which level descriptor matches best with the candidate's response: remember that you should be considering the overall quality of the response. Then decide which mark to award within the level. Award the higher mark in the level if there is a good match with both the content statements and the communication statement.

## Marking abbreviations

The following may be used in marking schemes or in the marking of scripts to indicate reasons for the marks awarded.

| cao | $=$ | correct answer only |
| :--- | :--- | :--- |
| ecf | $=\quad$ error carried forward |  |
| bod | $=\quad$ benefit of doubt |  |

| Question |  |  | Marking details | Marks available |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | A01 | AO2 | AO3 | Total | Maths | Prac |
| 1 | (a) |  |  | Thermistor A and wider / greater / larger variation of resistance [between $20^{\circ} \mathrm{C}$ and $60^{\circ} \mathrm{C}$ ] |  | 1 |  | 1 |  |  |
|  | (b) | (i) | As temperature falls $R$ of thermistor increases (1) Thermistor resistance is a larger fraction of total $R$ (1) Since $V$ increases as $R$ increases, $V_{\text {out }}$ must increase (1) Accept alternative based on current. Accept reference to formulae. | 1 | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |  | 3 |  |  |
|  |  | (ii) | Correct use of potential divider equation for $A$ and $B$ (1) Correct reading from graph at $10^{\circ} \mathrm{C}$ for both A and $\mathrm{B}(1)$ Correct conclusion - A possible, B not possible (1) <br> Thermistor A: Either: <br> Apply potential divider equation to determine minimum value of variable resistor for $V_{\text {out }}=2[\mathrm{~V}]$ <br> i.e. $2=\frac{9 \times 10}{(10+R)}$ <br> $R=35 \mathrm{k}[\Omega]$ which is within range for the variable resistor, so possible <br> Or: <br> Determine max possible $V_{\text {out }}$ at $10^{\circ} \mathrm{C}$ <br> i.e. $V_{\text {out }}=\frac{9 \times 10}{(10+20)}$ <br> $V_{\text {out }}=3[\mathrm{~V}]$, which is above requirement, so possible. |  |  | 3 | 3 | 2 |  |

| Question | Marking details | Marks available |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A01 | AO2 | AO3 | Total | Maths | Prac |
|  | Thermistor B: Either: <br> Apply potential divider equation to determine minimum value of variable resistor for $V_{\text {out }}=2 \mathrm{~V}$ <br> i.e. $2=\frac{9 \times 5}{(5+R)}$ <br> $R=17.5 \mathrm{k}[\Omega]$, which is below min of range for the variable <br> resistor, so not possible <br> Or: <br> Determine max possible $V_{\text {out }}$ at $10^{\circ} \mathrm{C}$ <br> i.e. $V_{\text {out }}=\frac{9 \times 5}{(5+20)}$ <br> $V_{\text {out }}=1.8[\mathrm{~V}]$, which is below requirement, so not possible. <br> Alternative approach: <br> Ratio of pds $=\frac{2}{7}(1)$ <br> Both values of $R$ of thermistor at $10^{\circ} \mathrm{C}$ from graph i.e. $10 \mathrm{k} \Omega$ and $5 \mathrm{k} \Omega$ (1) <br> Equate ratios to show thermistor $A$ is possible and thermistor $B$ is not e.g. <br> For $\mathrm{A}: \frac{2}{7}=\frac{10}{R_{\text {variable }}}$ and for $\mathrm{B}: \frac{2}{7}=\frac{5}{R_{\text {variable }}}$ (1) <br> Or: <br> use $\frac{2}{7}(1)$ <br> ratio to determine allowable range of resistance $-5.7 \mathrm{k} \Omega$ and $14.3 \mathrm{k} \Omega(1)$ <br> Conclusion (1) |  |  |  |  |  |  |

| Question | Marking details | Marks available |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A01 | AO2 | AO3 | Total | Maths | Prac |
|  | Alternative approach: <br> Calculate $V_{\text {out }}$ for both 20 k and 50 k , which will yield 3 V and 1.5 V for thermistor A (1) <br> For thermistor B , the corresponding voltages will be 1.8 V and 0.82 V (1) <br> Conclusion (1) |  |  |  |  |  |  |
| (iii) | First mark for either: <br> Determination of $V$ across variable resistor $(7 \mathrm{~V})$ and $R$ across variable resistor ( $35 \mathrm{k} \Omega$ ) (possible ecf) if using $P=\frac{V^{2}}{R}$ <br> Or: <br> Determination of $I\left(2 \times 10^{-4} \mathrm{~A}\right)$ and $R$ across variable resistor ( $35 \mathrm{k} \Omega$ ) (possible ecf) (if using $P=I^{2} R$ ) <br> Or: <br> Determination of $I\left(2 \times 10^{-4} \mathrm{~A}\right)$ and $V$ across variable resistor ( 7 V ) if using $P=I V$ $P=1.4 \mathrm{~m}[\mathrm{~W}](1)$ |  | 2 |  | 2 | 2 |  |
| (iv) | Small power output will have negligible effect on thermistor so OK |  |  | 1 | 1 |  |  |
|  | Question 1 total | 1 | 5 | 4 | 10 | 4 | 0 |
