

1. Define *electric field strength* at a point in space.

.....
.....

[Total 1 marks]

2. Fig. 1 shows a square flat coil of insulated wire placed in a region of a uniform magnetic field of flux density B . The direction of the field is vertically out of the paper. The coil of side x has N turns.

Fig. 1

- (a) (i) Define the term *magnetic flux*.

.....
.....
.....

[1]

- (ii) Show that the magnetic flux linkage of the coil in Fig. 1 is NBx^2 .

[2]

- (b) The coil of side $x = 0.020$ m is placed at position **Y** in Fig. 2. The ends of the 1250 turn coil are connected to a voltmeter. The coil moves sideways steadily through the region of magnetic field of flux density 0.032 T at a speed of 0.10 m s⁻¹ until it reaches position **Z**. The motion takes 1.0 s.

Fig. 2

- (i) Show that the voltmeter reading as the coil enters the field region, after $t = 0.20$ s, is 80 mV. Explain your reasoning fully.

- (ii) On Fig. 3, draw a graph of the voltmeter reading against time for the motion of the coil from **Y** to **Z**. Label the y-axis with a suitable scale.

Fig. 3

4. (a) Define *magnetic flux density*.

.....

[2]

(b) The figure below shows an evacuated circular tube in which charged particles can be accelerated. A uniform magnetic field of flux density B acts in a direction perpendicular to the plane of the tube. Protons move with a speed v along a circular path within the tube.

(i) On the figure above draw an arrow at **P** to indicate the direction of the force on the protons for them to move in a circle within the tube.

[1]

(ii) State the direction of the magnetic field. Explain how you arrived at your answer.

.....

[2]

(iii) Write down an algebraic expression for the force F on a proton in terms of the magnetic field at point **P**.

.....

[1]

- (iv) Calculate the value of the flux density B needed to contain protons of speed $1.5 \times 10^7 \text{ m s}^{-1}$ within a tube of radius 60 m. Give a suitable unit for your answer.

$B = \dots\dots\dots\text{unit}\dots\dots\dots$

[5]

- (v) State and explain what action must be taken to contain protons, injected at twice the speed ($2v$), within the tube.

5. This question is about electric forces.

A very small negatively-charged conducting sphere is suspended by an insulating thread from support **S**. It is placed close to a vertical metal plate carrying a positive charge. The sphere is attracted towards the plate and hangs with the thread at an angle of 20° to the vertical as shown in Fig. 1.

Fig. 1

- (a) Draw at least **five** electric field lines on Fig. 1 to show the pattern of the field between the plate and the sphere.
- (b) The sphere of weight 1.0×10^{-5} N carries a charge of -1.2×10^{-9} C.
- (i) Show that the magnitude of the attractive force between the sphere and the plate is about 3.6×10^{-6} N.

[3]

[3]

- (ii) Hence show that the value of the electric field strength at the sphere, treated as a point charge, is 3.0×10^3 in SI units. State the unit.

unit for electric field strength is

[3]

- (c) The plate is removed. Fig. 2 shows an identical sphere carrying a charge of $+1.2 \times 10^{-9}$ C, mounted on an insulating stand. It is placed so that the hanging sphere remains at 20° to the vertical.

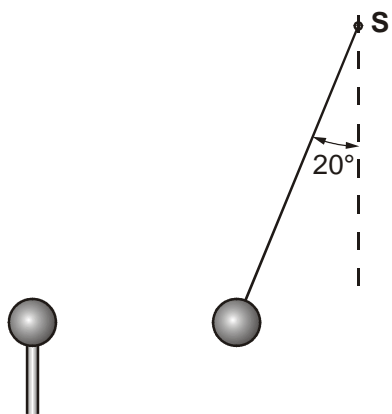

Fig. 2

Treating the spheres as point charges, calculate the distance r between their centres.

$r = \dots\dots\dots$ m

[3]

- (d) On Fig. 2, sketch the electric field pattern between the two charges. By comparing this sketch with your answer to (a), suggest why the distance between the plate and the sphere in Fig. 1 is half of the distance between the two spheres in Fig. 2.

- 6. A transformer is assumed to be 100% efficient in its operation. The primary coil is connected to a 230 V a.c. source. The secondary coil is connected to a 50 Ω resistor. The potential difference across the resistor is 12 V a.c.

Calculate

- (i) the current through the 50 Ω resistor

current = A

[2]

- (ii) the current in the primary circuit.

current = A

[2]

[Total 4 marks]

7. This question is about forcing a liquid metal, such as molten sodium, through a tube.

- (a) The liquid metal is in a tube of square cross-section, side w , made of electrically insulating material. See Fig. 1. Two electrodes are mounted on opposite sides of the tube and a magnetic field of flux density B fills the region between the electrodes. An electric current I passes across the tube between the electrodes, perpendicular to the magnetic field. The interaction between the current and the field provides the force to move the liquid.

Fig. 1

- (i) Draw on Fig. 1 an arrow labelled F to indicate the direction of the force on the liquid metal. Explain how you determined the direction.

.....

[2]

- (ii) State a relationship for the force F in terms of the current I , the magnetic field B and the width w of the tube.

.....

[1]

(iii) Data for this device are shown below.

$$B = 0.15 \text{ T}$$

$$I = 800 \text{ A}$$

$$w = 25\text{mm}$$

Calculate the force on the liquid metal in the tube.

force = N

[2]

(b) To monitor the speed of flow of the liquid metal, a similar arrangement of electrodes and magnetic field is set up further down the tube. See Fig. 2. A voltmeter is connected across the electrodes instead of a power supply.

Fig. 2

- (i) Explain, using the law of electromagnetic induction, why the voltmeter will register a reading which is proportional to the speed of flow of the metal.

.....

.....

.....

.....

.....

.....

.....

[3]

- (ii) State how and explain why the voltmeter reading changes when the magnetic flux density across the tube is doubled.

.....

.....
