

**Q1.** A muon is an unstable particle produced by cosmic rays in the Earth's atmosphere. Muons that are produced at a height of 10.7 km above the Earth's surface, travel at a speed of  $0.996c$  toward Earth, where  $c$  is the speed of light. In the frame of reference of the muons, the muons have a half-life of  $1.60 \times 10^{-6}$  s.

- (a) (i) Calculate how many muons will reach the Earth's surface for every 1000 that are produced at a height of 10.7 km.

number of muons .....

(3)

- (ii) Which of the following statements is correct? Tick (✓) the correct answer.

	✓ if correct
For an observer in a laboratory on Earth, the distance travelled by a muon that reaches the Earth is greater than the distance travelled by a muon in its frame of reference	
For an observer in a laboratory on Earth, time passes more slowly than it does for a muon in its frame of reference	
For an observer in a laboratory on Earth, the probability of a muon decaying each second is lower than it is for a muon in its frame of reference	

(1)

- (b) (i) Show that the total energy of an electron that has been accelerated to a speed of  $0.98c$  is about  $4 \times 10^{-13}$  J.

(2)

- (ii) The total energy of an electron travelling at a speed of  $0.97c$  is  $3.37 \times 10^{-13}$  J. Calculate the potential difference required to accelerate an electron from a speed of  $0.97c$  to a speed of  $0.98c$ .

potential difference = ..... V

- Q2.(a)** Calculate the speed of a particle at which its mass is twice its rest mass.

speed .....  $\text{m s}^{-1}$

(2)

- (b) Use the axes below to show how the mass  $m$  of a particle changes from its rest mass  $m_0$  as its speed  $v$  increases from zero.

Mark and label on the graph the point **P** where the mass of the particle is twice its rest mass.

(3)

- (c) By considering the relationship between the energy of a particle and its mass, explain why the theory of special relativity does not allow a matter particle to travel as fast as light.

.....

**Q5.** In a particle beam experiment, a pulsed beam of protons at a speed of  $1.00 \times 10^8 \text{ m s}^{-1}$  passed through a stationary detector in a time of 15.0 ns.

- (a) Calculate the length of the pulsed beam in
- (i) the frame of reference of the detector,

.....  
.....

- (ii) the frame of reference of the protons.

.....  
.....  
.....  
.....  
.....

(3)

- (b) (i) Calculate the kinetic energy of each proton in the beam, in J.

.....  
.....  
.....  
.....

.....  
.....  
.....

- (ii) The beam consisted of  $10^7$  protons. It passed through the detector and was stopped by a stationary target. Calculate the average power which the proton beam delivered to the target during the pulse.
