40 The nuclide ${ }_{86}^{222} \mathrm{Rn}$ decays in a sequence of stages to form the nuclide ${ }_{82}^{206} \mathrm{~Pb}$.
Four of the nuclides formed in the sequence are $\alpha$-particle emitters. The others are $\beta$-particle emitters.

How many nuclides formed in the decay sequence are $\beta$-particle emitters?
A 2
B 4
C 8
D 12

1 are absorbed to different extents in solids,
2 behave differently in an electric field,
3 behave differently in a magnetic field.
The diagrams illustrate these behaviours.

C emission of one $\alpha$-particle and two $\beta$-particles
D emission of two $\alpha$-particles and eight $\beta$-particles

39 When $\alpha$-particles are directed at gold leaf
1 almost all $\alpha$-particles pass through without deflection,
2 a few $\alpha$-particles are deviated through large angles.
What are the reasons for these effects?

|  | 1 | 2 |
| :---: | :---: | :---: |
| A | most $\alpha$-particles have enough energy <br> to pass right through the gold leaf | gold is very dense so a few low energy <br> $\alpha$-particles bounce back from the gold surface <br> B |
| most $\alpha$-particles miss all gold atoms | a few $\alpha$-particles bounce off gold atoms |  |
| C | the gold nucleus is very small so | occasionally the path of an $\alpha$-particle is |
| most $\alpha$-particles miss all nuclei | close to a nucleus |  |
| D | the positive charge in an atom is not <br> concentrated enough to deflect an $\alpha$-particle | occasionally an $\alpha$-particle experiences many <br> small deflections in the same direction |
