| $\mathbf{4}$ | (high resistance) so very little /negligible/zero current in the voltmeter <br> Or because otherwise a current would pass through the voltmeter <br> Or so the total resistance of the parallel combination isn't changed <br> Or because otherwise total resistance of parallel combination would <br> be reduced | (1) |
| because that would change /increase the current in the ammeter |  |  |
| Or |  |  |
| because that would mean the current through the ammeter was different |  |  |
| to (larger than) the current through the component |  |  |
