

1. Any **seven** from:
- $\alpha$  - particle scattering
  - suitable diagram with source, foil, moveable detector
  - 2 or more trajectories shown
  - vacuum
  - most particles have little if any deflection
  - large deflection of very few
  - reference to Coulomb's law /elastic scattering
  - alphas repelled by nucleus (positive charges)
  - monoenergetic
  - OR electron scattering
  - High energy diagram with source sample, moveable detector / film
  - Vacuum
  - Electron accelerator or other detail
  - Most have zero deflection
  - Characteristic angular distribution with minimum
  - Minimum not zero
  - De Broglie wavelength
  - Wavelength comparable to nuclear size hence high energy
- B1  $\times$  7
-  Clearly shows how evidence for the size of the nucleus follows from what is described. (1)

[8]

2. (a) He nucleus, a few cm / 3 to 10 cm
- About 1 m / 0.3 to 2 m / several m, 1 to 10 mm Al / 1 mm Pb
- (high energy) e-m radiation, 1 to 10 cm of Pb / several m of concrete
- only 2 correct 1 mark, only 4 correct 2 marks
- B3
- (b) Source, absorbers placed in front of detector on diagram
- Explanation of how results identify the source
- (2 marks possible)
- Allowance for background (max 2)
- (allow for distance expt to a max 2)
- B1  
B2

[6]

3. description:  
 (4) hydrogen or light nuclei/protons are fused together to form a helium/heavier/larger nucleus; (1)  
 two positrons must also be released; to conserve charge; (2)  
 the process is more complicated than the summary equation suggests/AW;  
 mass reduction provides energy release/  $\Delta m = \Delta E/c^2$  (1)  
 the process requires very high temperatures (to bring the protons together); (1)  
 normally achieved inside a star; only by man in a bomb so far; (1)  
 comparison: (2)  
 Energy release in fusion is much greater than in radioactive decay;  
 because mass reduction/change in fusion is much greater than in radioactive (1)  
 decay/AW; (1)  
 as the helium nucleus is so strongly bound; (1)  
 also energy release from annihilation of positrons; (1) max 5  
 Quality of Written Communication 2

[7]

4. (a) number of *decayed* U-238 nuclei =  $\frac{1}{2} \times$  number of *undecayed* U-238 nuclei; (1)  
 so 1/3 of U-238 has decayed and 2/3 of U-238 has not decayed; (1) 2  
 (so ratio = 2/3)

- (b) *either*  $\lambda = 0.693 / T_{1/2} = 0.693 / (4.47 \times 10^9)$  ( $= 1.55 \times 10^{-10} \text{ y}^{-1}$ ) subs. (1)  
 $N = N_0 e^{-\lambda t}$  so  $N/N_0 = e^{-\lambda t}$  and  $\ln(N/N_0) = -\lambda t$   
 $\ln(0.667) = -1.55 \times 10^{-10} t$  alg. / arith. (1)  
 so  $t = 2.61 \times 10^9 \text{ y}$  ans. (1) 3

- or*  $N/N_0 = (\frac{1}{2})^x$  so  $0.667 = (\frac{1}{2})^x$  and  $\ln(0.667) = x \ln(0.5)$   
 and  $x = 0.584$  then  $t = x T_{1/2} = 0.584 \times 4.47 \times 10^9 = 2.61 \times 10^9 \text{ y}$

- (c) *either*  $N_0 = (5.00 / 238) \times 6.02 \times 10^{23}$  subs. (1)  
 $= 1.26 \times 10^{22}$  atoms ans. (1) 2

- or*  $N_0 = (5.00 \times 10^{-3}) / (1.67 \times 10^{-27} \times 238)$  (1)  
 $= 1.26 \times 10^{22}$  atoms (1)

- (d) exponential decay graph for U: starts from  $N_0$  and approaches  $t$  axis; (1)  
 exponential growth of Pb from zero: approaches a constant value of  $N_0$ ; (1)  
 lines sensibly 'mirror images'; (1) 3

[10]

5. (a) Rb 94  
 Cs 55  
 U143  
 -1 for each error B2

- (b) Values from graph: U 7.4 MeV *allow 7.3 to 7.4*  
 Rb 8.6 MeV *allow 8.5 to 8.6* C1  
 Cs 8.4 MeV
- Total binding energies: U  $235 \times 7.4$  (1739)  
 Rb  $94 \times 8.6$  (808) B2  
 Cs  $142 \times 8.4$  (1193)
- Total energy released =  $808 + 1193 - 1739$  A1  
 = 262 MeV  
*allow  $8.6 + 8.4 - 7.4 = 9.4$  MeV for 1 mark only*

[6]

6. confines / pulls together plasma / nuclei / ions / nucleons / protons; (1)  
 so increases density/ concentration / number per unit volume; (1)  
 and increases frequency / number of collisions among nuclei; (1)  
 gravitational attraction heats plasma / gravitational p.e. changed to heat; (1)  
 any 3

[3]

7. (a) (i) to come to rest simultaneously, total mtm. = 0 *or* AW (1) 1  
 (but initial mtm. not zero)
- (ii) initial mtm. =  $3 m u - 2 m u = m u$  (1)  
 when closest, mtm. =  $(3m + 2m) v$  (1) 2  
 so  $5m v = m u$  (and  $v = u / 5$ )
- (b) (i) initial k.e. = final k.e. + (gain of) p.e. (1) 1
- (ii) k.e. =  $\frac{1}{2} m v^2$  (1)  
 total k.e. =  $\frac{1}{2} \times 3 m u^2 + \frac{1}{2} \times 2 m u^2$  (=  $2.5 m u^2$ ) (1)  
 =  $2.5 \times 1.67 \times 10^{-27} u^2$  (=  $4.18 \times 10^{-27} u^2$ ) (1) 3  
 allow  $m = 1.66 \times 10^{-27}$  kg for full credit
- (iii) gain of p.e. = initial k.e. – final k.e.  

$$\frac{(1.6 \times 10^{-19})^2}{(4\pi \times 8.85 \times 10^{-12} \times 1.5 \times 10^{-15})} = 4.18 \times 10^{-27} u^2 - 4.18 \times 10^{-27} (u/5)^2$$
 (2)  
 $1.53 \times 10^{-13} = 4.01 \times 10^{-27} u^2$  (1) *algebra*  
 $u = 6.18 \times 10^6 \text{ m s}^{-1}$  (1) 4  
 omits -  $4.18 \times 10^{-27} (u/5)^2$ , gets  $u = 6.06 \times 10^6 \text{ m s}^{-1}$ : 1/2, 1, 1 = 3/4

[11]

8. (a)  ${}^{239}_{92}\text{U} \rightarrow {}^{239}_{93}\text{Np} + {}^0_{-1}\beta / {}^0_{-1}\text{e} + \bar{\nu}$  (1)  
 allow  ${}^{238}_{92}\text{U} + {}^1_0\text{n}$  on LHS  
 ${}^{239}_{93}\text{Np} \rightarrow {}^{239}_{94}\text{Pu} + {}^0_{-1}\beta / {}^0_{-1}\text{e} + \bar{\nu}$  (1) 2  
 allow neutrino instead of antineutrino  
 omits neutrino altogether - gets 1/2
- (b) straight line starts from zero and reaches  $1.08 \times 10^{13}$  at  
 $t = 6.0 \times 10^5$  s or equivalent (1) 1
- (c) (i) rate of decay increases with time; (1)  
 because rate of decay increases with / is proportional to  
 number of nuclei; (1) 2
- (ii) (eventually) rate of decay (of  ${}^{239}_{93}\text{Np}$ ) = rate of formation (1) 1
- (iii)  $dN/dt = (-) \lambda N$  equation (1)  
 $\lambda = 0.693 / T_{1/2}$   
 so  $N = (dN/dt) / \lambda = 1.8 \times 10^7 / (0.693 / [2.04 \times 10^5])$  subs. (1)  
 $= 5.3 \times 10^{12}$  ans. (1) 3  
 calculation of  $\lambda$  gets 1/3
- (iv) correctly curved from zero to  $(5.3 \times 10^{12})$  or less (1) 1
9. (i) 3 points plotted; any point incorrect loses this mark 1
- (ii) curve through 3 points and heads down towards zero; (1)  
 line peaks between Br and origin; (1) 2
- (iii) BE per nucleus of  ${}^{235}_{92}\text{U} = 7.60 \times 235 (= 1786 \text{ MeV})$   
 BE of products  $= 8.20 \times 146 + 8.60 \times 87$  both lines (1)  
 $(= 1197 + 748 \text{ MeV})$   
 so energy released  $= (1197 + 748) - 1786$  (1)  
 $= 159 \text{ MeV}$  (1)  
 omits multiplication by nucleon number to get 9.2 MeV gets 0,1,0 = 1 3
