

1(a).

(i) Define density.

----- [1]

(ii) A volume of air measuring 3.0 m^3 has a mass of 3.9 kg .

Calculate its density.

----- kg/m^3 [2]

(b). Georgina does an experiment to test the hypothesis 'the reason why a solid floats or sinks in a liquid depends upon both the density of the solid and the density of the liquid'.

She was given blocks of rubber and wood and bottles of maple syrup and baby oil.

Material	Density (g/cm^3)
Rubber	1.52
Wood	0.85
Maple Syrup	1.37
Baby Oil	0.80

Material	Floats in Maple Syrup	Floats in Baby Oil
Rubber	No	No
Wood	Yes	No

Georgina concludes that the density of both the solid and the liquid affects whether it floats or sinks.

Use the data to justify Georgina's conclusion.

----- [2]

2(a). The diagram shows a common type of electric heater. It contains oil which is heated by an electrical element.

The table shows some information about the heater.

Electrical power	1500 W
230 V	Voltage rating
Specific heat capacity of oil	1600 J / kg °C
Mass of oil	4.5 kg

Show that more than 700 000 J of energy is needed to heat the oil from 20 °C to 120 °C.

Use the equation:

change in internal energy = mass × specific heat capacity × change in temperature

[2]

(b).

- (i) Use your answer to (a) to calculate the minimum time for the oil to reach a temperature of 120 °C, starting at 20 °C.

Minimum time = s [3]

- (ii) In practice, it will take longer than this for the heater to reach 120 °C.

State the reason for this.

----- [1]

3. Sarah carries out an experiment to measure the specific latent heat of vaporisation of water. She does this by finding the energy needed to evaporate a known mass of water.

The apparatus she uses is shown in Fig. 9.1.

Fig. 9.1

Using this apparatus, Sarah takes these readings.

	Measured value
current	3.0 A
potential difference	12 V
time	150 s
balance reading at start	185.3 g
balance reading at the end	184.3 g

Table 9.1

* Sarah is not happy with her results.

Sarah

The book says the specific latent heat of vaporisation of water should be 2300 J for every gram evaporated. The readings in **Table 9.1** give an answer that's far too big.

Is Sarah right?

What could Sarah do to get an accurate value of the specific latent heat of vaporisation of water from her experiment?

[6]

END OF QUESTION PAPER

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
1	a	i	Density = mass ÷ volume (1)	1	
		ii	FIRST CHECK ANSWER ON ANSWER LINE If answer = 1.3 (kg / m ³) award 2 marks 3.9 ÷ 3.0 (1) = 1.3 (kg / m ³) (1)	2	
	b		She is correct: Density of solid > density of liquid → solid sinks (1) Quotes data from the table in support of claim (1)	2	(No mark for just stating Georgina is correct) allow Rubber greater density than both liquids so does not float ora allow wood density 0.85 floats in maple syrup > density of 1.37 but sinks in baby oil < density of 0.80
			Total	5	
2	a		FIRST CHECK THE ANSWER If answer = 720 000 (J) award 2 marks substitution $4.5 \times 1600 \times (120-20) \checkmark$ = 720 000 (J) \checkmark	2 (AO 2.1) (AO 2.1)	ALLOW 20 or 120 for ΔT to give 144 000 or 864 000 Does not need comparison with 700 000 for the mark <u>Examiner's Comments</u> On the whole candidates were able to substitute the correct numbers into the given equation, and nearly all of them realised that it was the temperature change which was needed. This question was well answered.

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
	b	i	<p>FIRST CHECK THE ANSWER ON ANSWER LINE If answer = 480 (s) award 3 marks</p> <p>recall and rearrange: $\text{time} = \text{energy} / \text{power}$ ✓ substitution $720\,000 / 1500$ ✓ = 480 (s) ✓</p>	<p style="text-align: center;">3</p> <p>(AO 1.2) (AO 2.1) (AO 2.1)</p>	<p>ECF (a) or energy = 700 000 (J)</p> <p>ALLOW for 2 marks '48' or '4800' as a transcription error.</p> <p>Examiner's Comments</p> <p>Candidates found this question difficult as it required use of the data given on the previous page. The question stem referred to the rise in temperature so many candidates divided the value calculated in the previous part by the temperature difference as they were unable to recall and rearrange the equation.</p>
		ii	<p>energy transferred to the metal radiator / in the wires ✓</p>	<p style="text-align: center;">1</p> <p>(AO 1.1)</p>	<p>ALLOW 'energy is lost to the surroundings' IGNORE it heats up the room / ignore efficiency arguments DO NOT ALLOW 'loss' on its own</p> <p>Examiner's Comments</p> <p>This question was not well answered. Most candidates simply stated that the heater would not start at 20° C for instance or that the calculation was only approximate.</p>

Mark Scheme

Question	Answer/Indicative content	Marks	Guidance
3	<p><i>Please refer to the marking instructions on page 5 of this mark scheme for guidance on how to mark this question.</i></p> <p>Level 3 (5–6 marks) Correct calculation to check whether the value of SLH is greater than 2300 J/g AND specific evaluation / development.</p> <p><i>There is a well-developed line of reasoning which is clear and logically structured. The information presented is relevant and substantiated.</i></p> <p>Level 2 (3–4 marks) Correct calculation to check whether the value of SLH is greater than 2300 J/g OR Identifies at least one shortcoming of Sarah’s experiment OR suggests at least one valid improvement.</p> <p><i>There is a line of reasoning presented with some structure. The information presented is relevant and supported by some evidence.</i></p> <p>Level 1 (1–2 marks) May attempt to use data to check statement OR Makes generic suggestion(s) to improve the procedure, e.g. repeat readings, use a more accurate balance.</p> <p><i>There is an attempt at a logical structure with a line of reasoning. The information is in the most part relevant.</i></p> <p>0 marks <i>No response or no response worthy of credit.</i></p>	<p>6 (AO 2.2 × 2) (AO 3.1b × 2) (AO 3.3a × 2)</p>	<p>Indicative scientific points may include:</p> <p>AO2.2 Calculation of SLH</p> <ul style="list-style-type: none"> • $P = 3.0 \text{ A} \times 12 \text{ V} = 36 \text{ W}$ • $\Delta E = Pt = 36 \text{ W} \times 150 \text{ s} = 5400 \text{ J}$ • $\Delta m = \{185.3 \text{ g} - 184.3 \text{ g}\} = 1.0 \text{ g}$ • $L = \Delta E/\Delta m = 5400 \text{ J}/1.0 \text{ g} = 5400 \text{ J/g}$ <p>AO3.1b Evaluation of experiment</p> <ul style="list-style-type: none"> • Heat losses constitute the (most) significant shortcomings • Not all of heater in the water • Thermal energy will dissipate through sides and bottom of beaker • Thermal energy will dissipate from the water surface • Relatively low mass of water evaporated <p>AO3.3a Development of experimental procedure</p> <ul style="list-style-type: none"> • Ensure water level is above top of heater. • Surround beaker sides and bottom with insulating material • Cover top of beaker to limit convection losses (but still allow water vapour to escape) • Use higher powered heater to evaporate more water in the same time • Make sure water is boiling before starting measurements. • Longer time/higher current/voltage to evaporate more water. <p><u>Examiner’s Comments</u></p> <p>Candidates who did well on this question used the data to calculate the specific latent heat. They considered whether a reason for Sarah’s value being so high might be because of energy transfers to the surroundings environment and not just to the water. Finally they suggested how Sarah might minimise the unwanted energy transfers.</p>

Mark Scheme

Question	Answer/Indicative content	Marks	Guidance												
			<p>Only a very few candidates calculated the specific latent heat, although some wrote that Sarah should have calculated the value for it. Level 3 responses were expected to compare Sarah's calculated value with the expected value. Candidates were expected to know that this quantitative comparison would be required in order to find how accurate Sarah's value for latent heat of vaporisation was.</p> <p>Many candidates thought as the value for latent heat was too large it could be reduced by heating for a shorter time, with a lower powered heater, or with less water. Improvements such as repeating the experiment, checking for anomalous observations, and calculating a mean, were common suggestions. These should be standard scientific practice and these suggestions allowed lower ability candidates to be credited at the top of the Level 2 band.</p> <p style="color: purple;">Exemplar 7</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th></th> <th>Measured value</th> </tr> </thead> <tbody> <tr> <td>current</td> <td>3.0A</td> </tr> <tr> <td>potential difference</td> <td>12V</td> </tr> <tr> <td>time</td> <td>150s</td> </tr> <tr> <td>balance reading at start</td> <td>185.3g</td> </tr> <tr> <td>balance reading at the end</td> <td>184.3g</td> </tr> </tbody> </table> <p style="text-align: center; font-size: small;">Table 9.1</p> <div style="margin-left: 200px; margin-top: 10px;"> $V \times I \times \text{time} = 5100 \text{ J}$ </div> <p style="text-align: right; font-size: x-small; color: red;">SEEN</p> <p style="color: red; font-size: x-small;">(B1A)</p> <p style="font-family: cursive; font-size: small;"> Yes Sarah used Buco J to evaporate 1g of water. </p> <p style="font-family: cursive; font-size: small;"> Sarah could be more accurate if she emmed the heater fully. Increase the efficiency of the heater by insulating the beaker and fitting a top. </p> <p style="text-align: right; font-size: x-small;">[6]</p> <p>Exemplar 7 is a top of band Level 3 response. At first sight the answer may seem very brief. However the candidate has demonstrated all the criteria for a full mark response:</p>		Measured value	current	3.0A	potential difference	12V	time	150s	balance reading at start	185.3g	balance reading at the end	184.3g
	Measured value														
current	3.0A														
potential difference	12V														
time	150s														
balance reading at start	185.3g														
balance reading at the end	184.3g														

Mark Scheme

Question	Answer/Indicative content	Marks	Guidance
			<ul style="list-style-type: none"> • calculates the specific latent heat • suggests three improvements: <ul style="list-style-type: none"> ◦ ensuring the heater is immersed in the water ◦ insulating the beaker ◦ putting a top on the beaker. <p>Exemplar 8</p> <p>water from her experiment? [12]</p> <p>$2700 \text{ J} \times 185.3 = 426,10$</p> <p>She could make the experiment more accurate by increasing the voltage or current this would increase the heat of the electrical heater boiling water at a faster rate. She could do along the amount of time she does the experiment for. Another thing she could do is repeating the experiment multiple times. In case a mistake was made. I agree with Sorab's statement and think there is a mistake made in the student's response. [6]</p> <p>Exemplar 8 is a top of band Level 2 response. The candidate's attempted calculation is not helpful, but the suggestion to increase the heater output so the water heats at a faster rate would improve the accuracy. Changing the time confirms Level 2, but it would not be specific enough on its own.</p>
