M1 method for finding TPs
$(x-\theta)^{2}=\theta^{2} \Rightarrow x=0, y=0$ or $x=2 \theta, y=4 \theta \quad$ A1 stated or shown on graph
From graph, $\frac{x^{2}}{x-\theta} \leq 0$ or $\frac{x^{2}}{x-\theta} \geq 4 \theta \quad$ B1 graph must be correct

Since $4 \theta>0$, we have $\frac{x^{2}}{4 \theta(x-\theta)} \leq 0$ or $\frac{x^{2}}{4 \theta(x-\theta)} \geq 1$
so we have $\frac{\sin ^{2} \theta \cos ^{2} x}{1+\cos ^{2} \theta \sin ^{2} x} \leq 0$ or $\frac{\sin ^{2} \theta \cos ^{2} x}{1+\cos ^{2} \theta \sin ^{2} x} \geq 1$
However, it is clear that $(0 \leq) \frac{\sin ^{2} \theta \cos ^{2} x}{1+\cos ^{2} \theta \sin ^{2} x} \leq 1$
B1
(since numerator $\leq 1$ and denominator $\geq 1$ )
The 0 case occurs if and only if $x=0$ (on LHS) but, $\operatorname{since} \sin \theta \neq 0$,
the RHS is then non-zero (as $\cos 0=1$ )

$$
\begin{array}{rlr}
\frac{\sin ^{2} \theta \cos ^{2} x}{1+\cos ^{2} \theta \sin ^{2} x}=1 & \Leftrightarrow \text { both numerator } \& \text { denominator are } 1 & \text { M1 } \\
& \Leftrightarrow \sin ^{2} \theta=1 \text { and } \cos ^{2} x=1 & \text { M1 } \\
& \Leftrightarrow \theta=\frac{\pi}{2}, x=\pi &
\end{array}
$$

ALT. For the 1 case, we want $\sin ^{2} \theta \cos ^{2} x=1+\cos ^{2} \theta \sin ^{2} x$ when $x=2 \theta$
(from previous bit)
B1
Thus $\sin ^{2} \theta \cos ^{2} 2 \theta-\cos ^{2} \theta \sin ^{2} 2 \theta=1$
$\Rightarrow(\sin \theta \cos 2 \theta-\cos \theta \sin 2 \theta)(\sin \theta \cos 2 \theta+\cos \theta \sin 2 \theta)=1$
M1
$\Rightarrow(-\sin \theta)(\sin 3 \theta)=1$ or $\left(4 \sin ^{2} \theta+1\right)\left(\sin ^{2} \theta-1\right)=0$
This can only occur when either $\sin \theta=1$ and $\sin 3 \theta=-1$

$$
\text { or } \sin \theta=-1 \text { and } \sin 3 \theta=1 \text { M1 }
$$

Since $0<\theta<\pi$, this is only satisfied when $\theta=\frac{\pi}{2}, x=\pi \mathrm{A} 1$

7 (i) Step 1: If $a$ is not divisible by 3 then it is either one more than, or one less than, a multiple of 3 .

B1
$\Rightarrow a^{2}+b^{2}=(6+2 \sqrt{6}) b^{2} \quad$ M1 adding $b^{2}$ to both sides

$$
=2 \sqrt{3}(\sqrt{3}+\sqrt{2}) b^{2}=2 \sqrt{3} a b
$$

$\Rightarrow\left(a^{2}+b^{2}\right)^{2}=12 a^{2} b^{2} \Rightarrow a^{4}+b^{4}=10 a^{2} b^{2}$ A1 legitimately (AG)
Step 4: If $a=3 k$ then $b^{4}=90 k^{2} b^{2}-81 k^{4}=3\left(30 k^{2} b^{2}-27 k^{4}\right)$
Explanation that $3 \mid$ RHS $\Rightarrow 3 \mid$ LHS $\Rightarrow 3 \mid b$
E1 must be thorough
Step 5: Since $\operatorname{hcf}(a, b)=1, a$ can't be a multiple of 3 (from previous working)

## B1

So both $a^{2}$ and $a^{4} \equiv 1(\bmod 3)$

$$
\text { giving } 1+b^{4} \equiv b^{2}(\bmod 3)

(ii) If $a$ is not a multiple of 5 , it is $5 k \pm 1$ or $5 k \pm 2$

## B1

Squaring gives $a^{2} \equiv \pm 1 \quad\left(\right.$ and $\left.a^{4} \equiv 1\right)$
B1
$(\sqrt{6}+\sqrt{7})^{2}=13+2 \sqrt{42}$
and $(\sqrt{6}+\sqrt{7})^{4}=337+52 \sqrt{42} \quad$ M1 and relating back to $a, b$
so that $\left(\frac{a}{b}\right)^{4}=26\left(\frac{a}{b}\right)^{2}-1$
A1
$\times$ by $b^{4}$ and rearranging gives $a^{4}+b^{4}=26 a^{2} b^{2} \quad$ A1 legitimately ( $\mathbf{A G}$ )
Now if $a=5 k$ then $b^{4}=650 k^{2} b^{2}-625 k^{4}=5\left(130 k^{2} b^{2}-125 k^{4}\right)$
so if $a$ is a multiple of 5 then $b$ is also
E1
Since $a, b$ co-prime, this doesn't happen

$$
\begin{array}{cl}
\text { so } a^{4}+b^{4}=26 a^{2} b^{2} \text { becomes } & \text { M1 considering this } \bmod 5 \\
1+b^{4} \equiv \pm b^{2} & \mathbf{A 1}
