SPECIMEN MATERIAL

A-level CHEMISTRY (7405/3)

Paper 3

Specimen 2015

Session

Time allowed: 2 hours

Materials

For this paper you must have:

- the Data Booklet, provided as an insert
- a ruler
- a calculator.

Instructions

- Answer **all** questions.
- Show all your working.

Information

• The maximum mark for this paper is 90.

Please write clearly, in block capitals, to allow character computer recognition.

	Section A
	Answer all questions in this section.
1	Ethanol can be oxidised by acidified potassium dichromate(VI) to ethanoic acid in a two-step process.
01.1	In order to ensure that the oxidation to ethanoic acid is complete, the reaction is carried out under reflux.
	Describe what happens when a reaction mixture is refluxed and why it is necessary, in
	[3 marks]
01.2	Write a half-equation for the overall oxidation of ethanol into ethanoic acid. [1 mark]

01.3	The Tab l	boiling points of the o l e 1 .	rganic compound	s in a reaction mix	xture are shown ir	1
			Tab	le 1

Include in your a ould minimise the description in wor	obtain a sample o answer a descript loss of ethanal. ` rds or a labelled s	f ethanal from a n ion of the apparat Your description c ketch. [5	hixture tus you of the marks]
		Que	estion 1 continue	es on the next pa	ige	

01.4	Use your knowledge of structure and bonding to explain why it is possible to separate ethanal in this way. [2 marks]
0 1 . 5	A student obtained a sample of a liquid using the apparatus in Question 1.3 . Describe how the student could use chemical tests to confirm that the liquid contained
	ethanal and did not contain ethanoic acid. [5 marks]

2	Ethanol and ethanoic acid react reversibly to form ethyl ethanoate and water ac to the equation:	cording
	$CH_3COOH + CH_3CH_2OH \rightleftharpoons CH_3COOCH_2CH_3 + H_2O$	
	A mixture of 8.00 × 10^{-2} mol of ethanoic acid and 1.20 × 10^{-1} mol of ethanol is a to reach equilibrium at 20 °C.	allowed
	 The equilibrium mixture is placed in a graduated flask and the volume made 250 cm³ with distilled water. A 10.0 cm³ sample of this equilibrium mixture is titrated with sodium hydrox added from a burette. 	e up to (ide
	 The ethanoic acid in this sample reacts with 3.20 cm³ of 2.00 × 10⁻¹ mol dn sodium hydroxide solution. 	n ⁻³
02.1	Calculate the value for K_c for the reaction of ethanoic acid and ethanol at 20 °C. Give your answer to the appropriate number of significant figures.	markal

02.5	The error in the mean titre for this experiment is ± 0.15 cm ³ .
	Calculate the percentage error in this mean titre.
	נו וומואן
	Percentage error = %
02.6	Suggest how, using the same mass of ethanoic acid, the experiment could be improved to reduce the percentage error.
	[2 marks]
	Turn over for the next question

3	A peptide is hydrolysed to form a solution containing a mixture of amino acids. This mixture is then analysed by silica gel thin-layer chromatography (TLC) using a toxic solvent. The individual amino acids are identified from their R _f values.
	Part of the practical procedure is given below.
03.1	 Part of the practical procedure is given below. 1. Wearing plastic gloves to hold a TLC plate, draw a pencil line 1.5 cm from the bottom of the plate. 2. Use a capillary tube to apply a very small drop of the solution of amino acids to the mid-point of the pencil line. 3. Allow the spot to dry completely. 4. In the developing tank, add the developing solvent to a depth of not more than 1 cm. 5. Place your TLC plate in the developing tank. 6. Allow the developing solvent to rise up the plate to the top. 7. Remove the plate and quickly mark the position of the solvent front with a pencil. 8. Allow the plate to dry in a fume cupboard. Parts of the procedure are in bold text. For each of these parts, consider whether it is essential and justify your answer. [4 marks]
L	

Г

03.2	Outline the steps needed to locate the positions of the amino acids on the T and to determine their R_f values.	LC plate
		[4 marks]
03.3	Explain why different amino acids have different R_f values.	[2 marke]

4 Ethanedioic acid is a weak acid. Ethanedioic acid acts, initially, as a monoprotic acid. HO OH 04.1 Use the concept of electronegativity to justify why the acid strengths of ethanedioic acid and ethanoic acid are different. [6 marks]

04.2	A buffer solution is made by adding 6.00×10^{-2} mol of sodium hydroxide to a containing 1.00×10^{-1} mol of ethanedioic acid ($H_2C_2O_4$). Assume that the sodium hydroxide reacts as shown in the following equation in this buffer solution, the ethanedioic acid behaves as a monoprotic acid.	a solution
	$H_2C_2O_4(aq) + OH^-(aq) \longrightarrow HC_2O_4^-(aq) + H_2O(I)$	
	The dissociation constant K_a for ethanedioic acid is 5.89 × 10 ⁻² mol dm ⁻³ .	
	Calculate a value for the pH of the buffer solution. Give your answer to the appropriate number of significant figures.	[5 marks]
	pH =	
	Question 4 continues on the next page	

04.3	In a titration, the end point was reached when 25.0 cm ³ of an acidified solution containing ethanedioic acid reacted with 20.20 cm ³ of 2.00×10^{-2} mol dm ⁻³ potassium manganate(VII) solution.	1
	Deduce an equation for the reaction that occurs and use it to calculate the orig concentration of the ethanedioic acid solution.	jinal
	[4	4 marks]
	Equation	
	Calculation	
	Original concentration =r	mol dm ⁻³

5	A sample of ethanedioic acid was treated with an excess of an unknown alcohol in the presence of a strong acid catalyst. The products of the reaction were separated and analysed in a time of flight (TOF) mass spectrometer. Two peaks were observed at $m/z = 104$ and 118.
05.1	Identify the species responsible for the two peaks. [2 marks]
0 5 . 2	Outline how the TOF mass spectrometer is able to separate these two species to give two peaks.

Answer all questions in this section. Only one answer per question is allowed. For each answer completely fill in the circle alongside the appropriate answer. CORRECT METHOD • WRONG METHODS • • • • • • • • • • • • • • • • • • •				Section	В	
Only one answer per question is allowed. For each answer completely fill in the circle alongside the appropriate answer.
