## Chemistry

### Advanced

### PAPER 3: General and Practical Principles in Chemistry

**Candidates must have:** Scientific calculator

Data Booklet

Ruler

Total Marks

### Instructions

- Use **black** ink or **black** ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  - *there may be more space than you need.*

### Information

- The total mark for this paper is 120.
- The marks for **each** question are shown in brackets
  - *use this as a guide as to how much time to spend on each question.*
- For the question marked with an **asterisk (\*)**, marks will be awarded for your ability to structure your answer logically showing the points that you make are related or follow on from each other where appropriate.
- A Periodic Table is printed on the back cover of this paper.

### Advice

- Read each question carefully before you start to answer it.
- Show all your working in calculations and include units where appropriate.
- Check your answers if you have time at the end.
- Good luck with your examination.

**Answer ALL the questions.**

**Write your answers in the spaces provided.**

1 This question is about chlorine.

(a) Chlorine has two isotopes with mass numbers 35 and 37.

(i) Complete the table to show the numbers of subatomic particles in a  $^{35}\text{Cl}$  atom and a  $^{37}\text{Cl}^-$  ion.

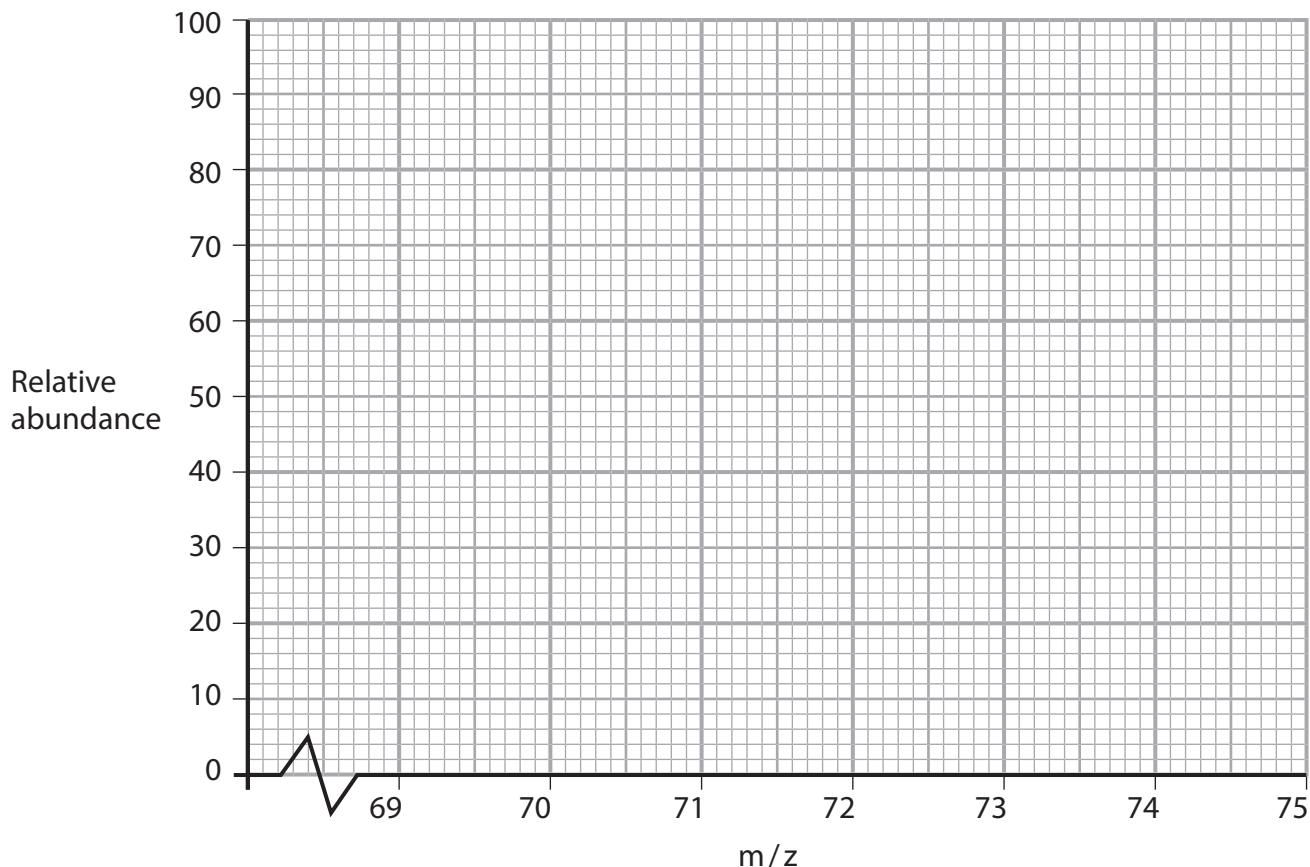

(2)

Particle	Protons	Neutrons	Electrons
$^{35}\text{Cl}$ atom			
$^{37}\text{Cl}^-$ ion			

(ii) A sample of chlorine contained 75% of  $^{35}\text{Cl}$  and 25% of  $^{37}\text{Cl}$ .

Complete the mass spectrum to show the peaks you would expect for the molecular ion  $\text{Cl}_2^+$  from this sample of chlorine gas.

(2)

(b) Write the formula of potassium chlorate(V).

(1)

(c) Write the equation for the first electron affinity of chlorine. Include state symbols.

(2)

(d) The standard electrode potential for the chlorine / chloride ion half-cell is

- (i) Identify an oxidising agent from the Data Booklet that will convert chloride ions into chlorine under standard conditions.

(1)

- (ii) Calculate the value of  $E_{\text{cell}}^\ominus$  for the reaction in (d)(i).

(1)

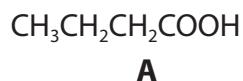

**(Total for Question 1 = 9 marks)**

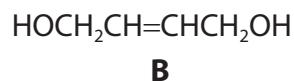

P 6 7 8 0 6 A 0 3 3 6

- 2 Analysis shows that a compound has the molecular formula C<sub>4</sub>H<sub>8</sub>O<sub>2</sub>.

A student suggests that the compound could be either **A** or **B**.

or

- (a) Deduce a **chemical** test which would give a positive result for **A** but **not** for **B**.  
Include the reagent and observation.

(2)

---

---

---

---

---

---

---

---

- (b) Deduce a **chemical** test which would give a positive result for **B** but **not** for **A**.  
Include the reagent and observation.

P 6 7 8 0 6 A 0 5 3 6

3 This question is about aluminium chloride.

(a) Complete the electronic configuration of an aluminium atom.

(1)

1s<sup>2</sup> .....

(b) At high temperatures, aluminium chloride exists as AlCl<sub>3</sub> molecules.

(i) Draw a dot-and-cross diagram of an aluminium chloride molecule, AlCl<sub>3</sub>.  
Show the outer shell electrons only.

(1)

(ii) Predict the shape of an AlCl<sub>3</sub> molecule and the Cl–Al–Cl bond angle.

(2)

Shape of AlCl <sub>3</sub>	
Cl–Al–Cl bond angle	

DO NOT WRITE IN THIS AREA

(iii) Aluminium chloride is used as a catalyst in the alkylation of benzene.

Draw the mechanism for the reaction between benzene and chloromethane using aluminium chloride as the catalyst.

Include an equation for the formation of the electrophile, and any relevant curly arrows.

(4)

(c) Aluminium chloride exists as a dimer,  $\text{Al}_2\text{Cl}_6$ , just above its boiling temperature.

(i) Draw a diagram to show how two  $\text{AlCl}_3$  molecules are joined together in the dimer.

(1)

(ii) State the type of bond that joins the two  $\text{AlCl}_3$  molecules together.

(1)

**(Total for Question 3 = 10 marks)**

P 6 7 8 0 6 A 0 7 3 6

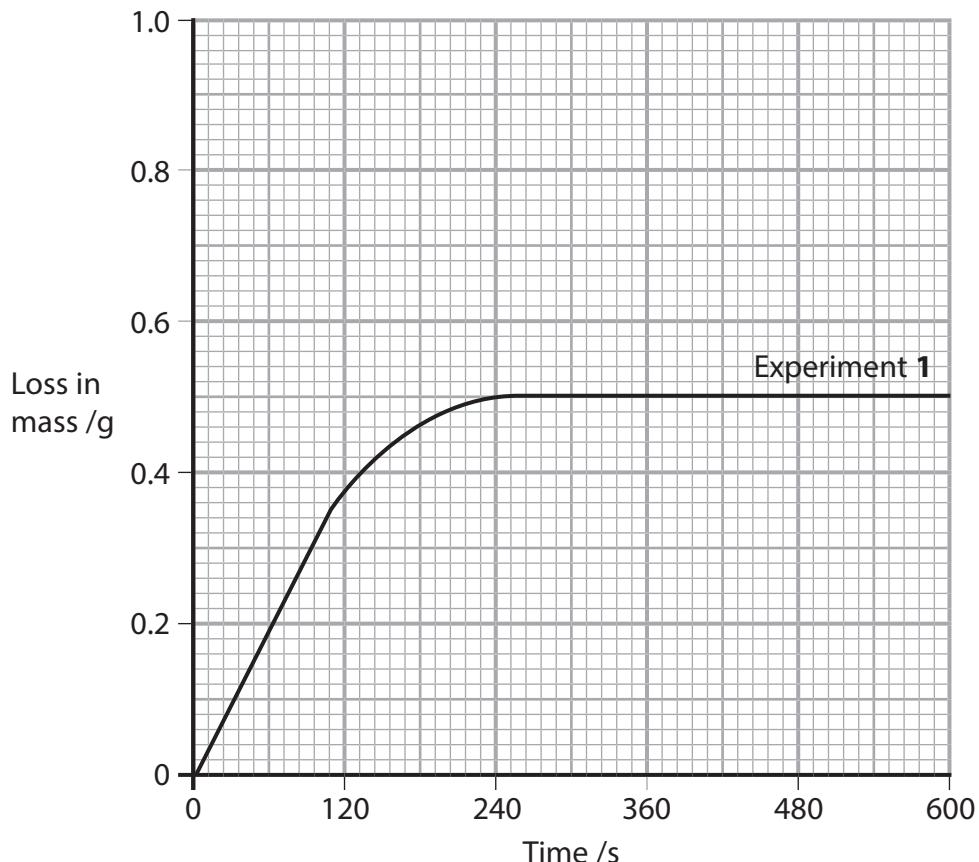

- 4 A series of experiments was carried out to investigate the factors which affect the rate of reaction between calcium carbonate and dilute hydrochloric acid.

- 50.0 cm<sup>3</sup> of hydrochloric acid was added to 10 g of calcium carbonate (an excess) in a conical flask placed on an electronic balance.
- The loss in mass of the flask and its contents was recorded every 30 seconds for 10 minutes.
- The experiment was repeated using different sized pieces of calcium carbonate, a different concentration of hydrochloric acid or a different temperature.

Experiment	Size of calcium carbonate	Concentration of hydrochloric acid / mol dm <sup>-3</sup>	Temperature /°C
1	small pieces	0.50	20
2	small pieces	0.50	60
3	one large piece	0.50	20
4	small pieces	1.00	20

The results of Experiment 1 are shown on the graph.

- (a) Draw curves on the graph to show the results you would expect for Experiments 2, 3 and 4. Label the curves 2, 3 and 4.

5 Tests are carried out on aqueous solutions of two salts, **X** and **Y**.

(a) **X** contains one cation and one anion.

The observations for each test are recorded in the table.

(i) Complete the table by writing the names or formulae of the species.

(2)

Test	Observation	Inference
<b>Test 1</b>  Add aqueous sodium hydroxide to an aqueous solution of <b>X</b>	A green precipitate forms  The precipitate turns brown on the top after a few minutes	The cation in <b>X</b> is  .....
<b>Test 2</b>  To an aqueous solution of <b>X</b> , add dilute hydrochloric acid followed by aqueous barium chloride	A white precipitate forms	The anion in <b>X</b> is  .....

(ii) Write the ionic equation for the reaction between the cation in **X** and aqueous sodium hydroxide in **Test 1**. Include state symbols.

(2)

(iii) Give a reason why the green precipitate turns brown on the top after a few minutes.

(1)

(iv) Give a reason why dilute hydrochloric acid is needed in **Test 2**.

(1)

DO NOT WRITE IN THIS AREA

- (b) Y contains one cation and one anion.

The observations for each test are recorded in the table.

- (i) Complete the table by writing the names or formulae of the species.

(2)

Test	Observation	Inference
<b>Test 3</b>  Add dilute aqueous ammonia to an aqueous solution of Y until it is present in excess	A pale blue precipitate forms The precipitate dissolves in excess ammonia to form a deep blue solution	The cation in Y is .....
<b>Test 4</b>  To an aqueous solution of Y, add dilute nitric acid followed by aqueous silver nitrate	A white precipitate forms	The anion in Y is .....

- (ii) Give the formula of the complex ion present in the deep blue solution at the end of **Test 3**.

(1)

- (iii) Give a reagent that could be added to the mixture at the end of **Test 4** to confirm the identity of the anion in Y.

Include the observation when this reagent is added.

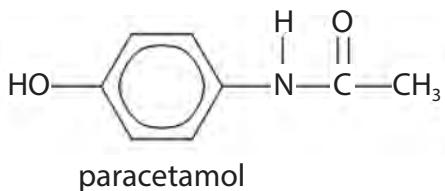

(2)

**(Total for Question 5 = 11 marks)**

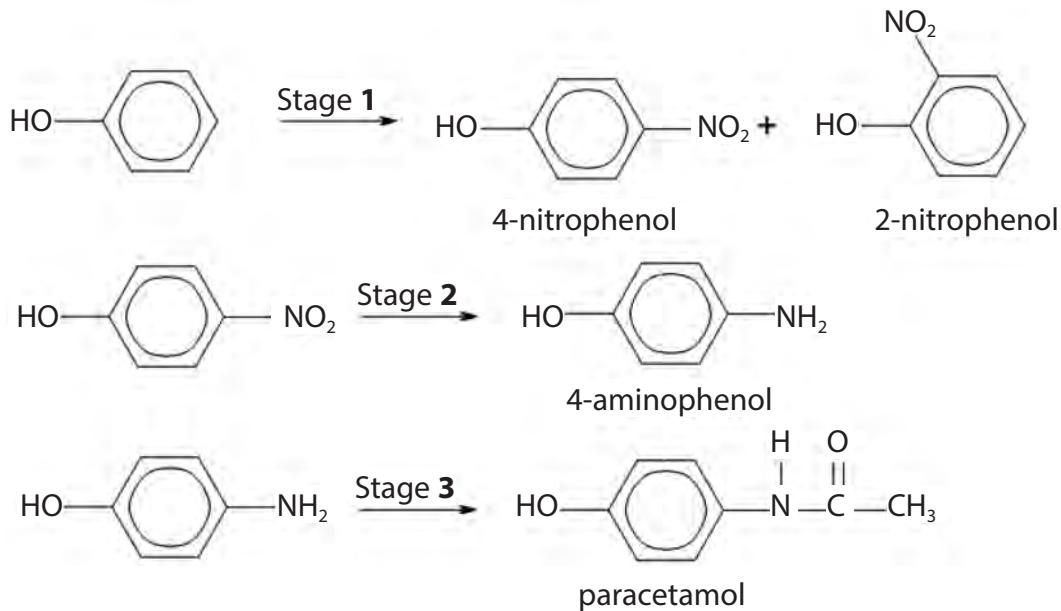

P 6 7 8 0 6 A 0 1 3 3 6

- 6 This question is about the preparation and analysis of paracetamol.

Paracetamol may be prepared from phenol in three stages.

- (a) In Stage 1, phenol is nitrated using dilute nitric acid.

The nitration of benzene requires concentrated nitric acid at 55°C with a catalyst of concentrated sulfuric acid.

Both these reactions are electrophilic substitution.

- (i) Explain why phenol can be nitrated using milder conditions than benzene.

(2)

- (b) State the **type** of reagent needed to convert 4-nitrophenol into 4-aminophenol in Stage **2**.

(1)

- (c) The outline procedure for Stage **3** is:

- place 1.0 g of 4-aminophenol in a conical flask. Add 9 cm<sup>3</sup> of distilled water and stir the mixture
- add 1 cm<sup>3</sup> of ethanoic anhydride to the flask and shake the mixture until a precipitate of impure paracetamol forms
- remove the paracetamol by filtration under reduced pressure
- recrystallise the paracetamol using water as the solvent
- determine the melting temperature of the pure, dry paracetamol.

- (i) Draw a labelled diagram of the apparatus used for filtration under reduced pressure.

(3)

DO NOT WRITE IN THIS AREA

- (ii) Describe the recrystallisation process to obtain a pure, dry sample of paracetamol.

- (d) The percentage by mass of paracetamol in three brands of paracetamol tablets are shown in the table.

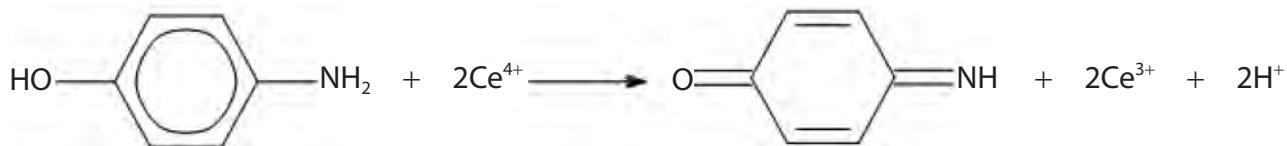

Brand of tablet	Percentage by mass of paracetamol
P	92.1
Q	93.6
R	99.7

The amount of paracetamol in a tablet can be determined using a titration with cerium(IV) ions.

The tablets are crushed and then hydrolysed in acid to form 4-aminophenol.

4-aminophenol is oxidised by cerium(IV) ions.

A tablet from one of the three brands of paracetamol was analysed following the outline procedure.

- one of the tablets was crushed and 0.500 g of the powder was added to dilute sulfuric acid
- the mixture was heated under reflux until the hydrolysis was complete
- the solution was made up to 100.0 cm<sup>3</sup> in a volumetric flask
- 25.0 cm<sup>3</sup> portions of the solution were titrated against 0.100 mol dm<sup>-3</sup> Ce<sup>4+</sup> using ferroin as indicator

### Result

The mean titre was 16.50 cm<sup>3</sup>.

DO NOT WRITE IN THIS AREA

(i) Give the molecular formula of paracetamol.

(1)

(ii) Determine, by calculation, which brand of tablet was analysed.

(5)

**(Total for Question 6 = 21 marks)**

- 7 The enthalpy change for the decomposition of sodium hydrogencarbonate can be determined indirectly using Hess's Law.

A student carried out two experiments.

- (a) **Experiment 1** involved the reaction between sodium hydrogencarbonate and hydrochloric acid.

The student used the following procedure:

- use a measuring cylinder to measure  $50\text{ cm}^3$  of  $2.00\text{ mol dm}^{-3}$  hydrochloric acid and pour it into a polystyrene cup
- measure the initial temperature of the acid
- weigh the test tube containing sodium hydrogencarbonate
- tip the sodium hydrogencarbonate into the hydrochloric acid in the polystyrene cup, stir the mixture and record the lowest temperature reached
- weigh the empty test tube.

### Results

Measurement	Value
Mass of test tube + $\text{NaHCO}_3$ / g	21.23
Mass of empty test tube / g	15.61
Mass of $\text{NaHCO}_3$ used / g	
Initial temperature / $^\circ\text{C}$	21.0
Final temperature / $^\circ\text{C}$	14.4
Temperature fall / $^\circ\text{C}$	

- (i) Complete the table.

(1)

- (ii) Show, by calculation, that the hydrochloric acid is in excess.  
You must show your working.

- (b) **Experiment 2** involved the reaction between sodium carbonate and hydrochloric acid.

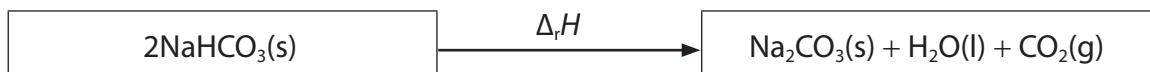

The student repeated the procedure for **Experiment 1** but used sodium carbonate instead of sodium hydrogencarbonate and measured the maximum temperature rise.

The student calculated the enthalpy change for this reaction as  $-29.4 \text{ kJ mol}^{-1}$ .

- (i) Complete the Hess cycle with appropriate formulae and labelled arrows.

(2)

- (ii) Calculate the enthalpy change for the decomposition of sodium hydrogencarbonate.

Include a sign and units in your answer.

(3)

DO NOT WRITE IN THIS AREA

- (c) Another student carried out the same two experiments and obtained a value for the enthalpy change of decomposition of sodium hydrogencarbonate of  $+74 \text{ kJ mol}^{-1}$ .

The data book value for this enthalpy change is  $+90 \text{ kJ mol}^{-1}$ .

- (i) Calculate the percentage error in this student's value.

(1)

- (ii) Calculate the percentage uncertainties in measuring  $50 \text{ cm}^3$  of hydrochloric acid using a burette and using a measuring cylinder.

(1)

Apparatus	Uncertainty	Percentage uncertainty
Measuring cylinder	$\pm 0.5 \text{ cm}^3$ for each volume measured	
Burette	$\pm 0.05 \text{ cm}^3$ for each reading	

- (iii) Give a reason why using a burette rather than a measuring cylinder will not improve the accuracy of the experiment.
