26. Part (a) for each section:

A totally wrong reagent scores zero
An incomplete reagent such as silver nitrate for Tollens, loses the reagent mark, but can get both observation marks.
A wrong reagent such as $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{2+}$ or bromide water loses the reagent mark and the next mark "gained", i.e. can only score $1 / 3$ if both observations correct
If two test given and results given correctly for both compounds in both tests then full marks
If one test on A and a different test on B with only these results given
if both results correct then score $2 / 3$
if either result wrong then score $1 / 3$
if either test would not work as a distinction, then score $0 / 3$
If the candidate says $\mathrm{A}=$ ketone ( or $\mathrm{C}=$ benzene), lose this mark.
If the candidate omits the letters when referring to the pair of compounds, e.g. says alkene decolourises / alkane no reaction penalise one mark only.
(a) (i) penalise observations which just say colour change occurs or only state starting colour
