1. This question looks at the chemistry of transition elements.

(a) (i) Explain what is meant by the terms *transition element*, *complex ion* and *ligand*,

(ii) Discuss, with examples, equations and observations, the typical reactions of transition elements.

In your answer you should make clear how any observations provide evidence for the type of reaction discussed.

[11]

(b) Describe, using suitable examples and diagrams, the different shapes and stereoisomerism shown by complex ions.

In your answer you should make clear how your diagrams illustrate the type of stereoisomerism involved.

(Allow 3 lined pages).

[Total 20 marks]

2. Mercury thermometers are not used in some laboratories because of the danger of mercury vapour. This vapour is very easily absorbed through the lungs into the blood.

In the blood, mercury reacts with hydrogen peroxide to form mercury(II) oxide.

$$Hg + H_2O_2 \rightarrow HgO + H_2O$$

The mercury(II) oxide formed accumulates within organs in the body.

Use oxidation numbers to show that the reaction between mercury and hydrogen peroxide is an example of both oxidation and reduction.

.....

.....

.....

[Total 2 marks]

3. Mercury forms two ions, Hg_2^{2+} and Hg^{2+}. The table shows the electronic configuration of mercury in these ions.

ion	electronic configuration
Hg_2^{2+}	$[Xe]4f^{14}5d^{10}6s^1$
Hg^{2+}	$[Xe]4f^{14}5d^{10}$

Use the electronic configurations to explain why mercury is **not** a transition element.

[Total 5 marks]

5. The percentage purity of a sample of manganese(IV) oxide, MnO_2, can be determined by its reaction with acidified iron(II) ions.

- Stage 1 – A sample of known mass of the impure MnO_2 is added to a conical flask.
- Stage 2 – The sample is reacted with a known excess amount of Fe^{2+} acidified with dilute sulphuric acid.
- Stage 3 – The contents of the flask are heated gently.
- Stage 4 – The cooled contents of the flask are titrated with aqueous potassium manganate(VII) in acidic conditions to find the amount of unreacted Fe^{2+}.

(i) The reduction half-equation for manganese(IV) oxide in the presence of dilute acid is shown below.

$$MnO_2(s) + 4H^+(aq) + 2e^- \rightarrow Mn^{2+}(aq) + 2H_2O(l)$$

Construct the balanced equation for the redox reaction between $Fe^{2+}(aq)$, $MnO_2(s)$ and $H^+(aq)$.

.....

.....

.....

[1]

(ii) In Stage 1 and Stage 2 a student uses a 0.504 g sample of impure MnO_2 and 100 cm^3 of 0.200 mol dm^{-3} Fe^{2+}.

In Stage 4 the student determines that the amount of unreacted Fe^{2+} is 0.0123 mol.

1 mol of MnO_2 reacts with 2 mol of Fe^{2+}.

Calculate the percentage purity of the impure sample of MnO_2.

percentage purity = ... %

6. Ruthenium (Ru) is a metal in the second transition series. It forms complex ions with the following formulae.

A = $[Ru(H_2O)_6]^{3+}$

B = $[Ru(H_2O)_5Cl]^{2+}$

C = $[Ru(H_2O)_4Cl_2]^{+}$

(a) (i) What is the oxidation number of ruthenium in **B**?

oxidation number of ruthenium = ...

[1]

(ii) One of the complex ions, **A**, **B** or **C**, shows stereoisomerism.

Draw diagrams to show the structures of the two isomers.

[2]

(iii) Name this type of stereoisomerism.

.....

[1]

(b) The complex ion $[Ru(H_2O)_6]^{3+}$ can be converted into $[Ru(H_2O)_5Cl]^{2+}$.

(i) Suggest a suitable reagent for this conversion.

.....

[1]

(ii) What type of reaction is this?

.....

[1]

7. The standard electrode potential of $Cu^{2+}(aq) + 2e^- \rightleftharpoons Cu(s)$ is +0.34 V.

A student measured the standard electrode potential of $Cu^{2+}(aq) + 2e^- \rightleftharpoons Cu(s)$. She was surprised to see that the emf of the cell was less than the expected value of +0.34 V.

She decided to measure the concentration of the $Cu^{2+}(aq)$ ions in the solution by titration.

25.00 cm^3 of the solution containing Cu^{2+} ions were pipetted into a volumetric flask and she made the volume up to 250.0 cm^3 with distilled water.

An excess of aqueous potassium iodide, KI, was added to 25.00 cm^3 of the diluted solution.
The iodine formed was titrated against 0.100 mol dm^{-3} sodium thiosulphate, $Na_2S_2O_3$.

The volume of $Na_2S_2O_3(aq)$ used was 23.20 cm^3.

The equations for the formation and titration of iodine are given below.

$$2Cu^{2+}(aq) + 4I^-(aq) \rightarrow 2CuI(s) + I_2(aq)$$

$$I_2(aq) + 2S_2O_3^{2-}(aq) \rightarrow 2I^-(aq) + S_4O_6^{2-}(aq)$$

(i) State how the student would identify the end point of the titration.

.....

.....

[1]

(ii) Show that the concentration of the $Cu^{2+}(aq)$ ions was 0.93 mol dm^{-3}.

[4]

(iii) Explain, in terms of chemical equilibrium, why the emf of this cell was less than the standard electrode potential.

18. The compound $FeSO_4.7H_2O$ can be used to kill moss in grass. Iron(II) ions in a solution of $FeSO_4.7H_2O$ are slowly oxidised to form iron(III) ions.

Describe a test to show the presence of iron(III) ions in a solution of $FeSO_4.7H_2O$.

.....

.....

[Total 1 mark]

19. The compound $FeSO_4.7H_2O$ can be used to kill moss in grass.

The percentage purity of an impure sample of $FeSO_4.7H_2O$ can be determined by titration against potassium dichromate(VI), $K_2Cr_2O_7$, under acid conditions, using a suitable indicator.

During the titration, $Fe^{2+}(aq)$ ions are oxidised to $Fe^{3+}(aq)$ ions.

- Stage 1 – A sample of known mass of the impure $FeSO_4.7H_2O$ is added to a conical flask.
- Stage 2 – The sample is dissolved in an excess of dilute sulphuric acid.
- Stage 3 – The contents of the flask are titrated against $K_2Cr_2O_7(aq)$.

(i) The reduction half equation for acidified dichromate(VI) ions, $Cr_2O_7^{2-}$, is as follows.

$$Cr_2O_7^{2-}(aq) + 14H^+(aq) + 6e^- \longrightarrow 2Cr^{3+}(aq) + 7H_2O(l)$$

Construct the balanced equation for the redox reaction between $Fe^{2+}(aq)$, $Cr_2O_7^{2-}(aq)$ and $H^+(aq)$.

.....

.....

.....

[2]

(ii) In Stage 1, a student uses a 0.655 g sample of impure $FeSO_4.7H_2O$.

In Stage 3, the student uses 19.6 cm^3 of 0.0180 mol dm^{-3} $Cr_2O_7^{2-}$ to reach the end-point.

One mole of $Cr_2O_7^{2-}$ reacts with 6 moles of Fe^{2+}.

Calculate the percentage purity of the impure sample of $FeSO_4.7H_2O$.

percentage purity .....

41. Compound **B** is an organic base. A student analysed this base by the procedure below.

He first prepared a solution of **B** by dissolving 4.32 g of **B** in water and making the solution up to 250 cm^3. The student then carried out a titration in which 25.00 cm^3 of this solution of **B** were neutralised by exactly 23.20 cm^3 of 0.200 mol dm^{-3} HC*l*.

1 mole of **B** reacts with 1 mole of HC*l*.

Use this information to calculate the molar mass of base **B** and suggest its identity.

Copper and iron are typical transition elements. One of the characteristic properties of a transition element is that it can form complex ions.

- Explain in terms of electronic configuration why copper is a transition element.
- Give an example of a complex ion that contains copper. Draw the three dimensional shape of the ion and describe the bonding within this complex ion.
- Transition elements show typical metallic properties. Describe **three other** typical properties of transition elements. Illustrate each property using copper or iron or their compounds.

43. Brass is a widely used alloy of copper. It is possible to analyse a sample of brass by

initially dissolving it in concentrated nitric acid.

(a) (i) What other metal is present in brass?

.....

[1]

(ii) Give **one** common use for brass and state the property of brass which makes it ideal for that purpose.

.....

.....

[1]

(b) During the analysis of brass, 1.65 g of the alloy was reacted with concentrated nitric acid. The resulting solution was neutralised, transferred to a volumetric flask and made up to 250 cm^3 using distilled water.

An excess of aqueous potassium iodide was added to a 25.0 cm^3 portion of the solution from the volumetric flask and the liberated iodine was titrated with 0.100 mol dm^{-3} sodium thiosulphate. 20.0 cm^3 of aqueous sodium thiosulphate were required to remove the iodine.

(i) What could be used to neutralise the excess nitric acid?

.....

[1]

(ii) What indicator is used in the titration of iodine with sodium thiosulphate?

.....

[1]

(iii) When is this indicator added to the titration mixture?

.....

[1]

(c) The reactions taking place in this titration may be summarised as follows.

$$2Cu^{2+} + 4I^{-} \rightarrow 2CuI + I_2$$

$$I_2 + 2S_2O_3^{2-} \rightarrow 2I^{-} + S_4O_6^{2-}$$

(i) Calculate the amount, in moles, of sodium thiosulphate in 20.0 cm^3 of solution.

answer ..... mol

[1]

(ii) For every one mole of Cu^{2+} ions present in solution, deduce the amount, in moles, of $S_2O_3^{2-}$ ions needed for the titration.

answer ..... mol

[1]

(iii) What is the amount, in moles, of Cu^{2+} ions present in 25.00 cm^3 of solution?

answer ..... mol

[1]

(iv) Calculate the percentage by mass of copper in the sample of brass.

answer ..... % Cu

44. The Co^{2+} ion can form complexes with two different co-ordination numbers.

(a) What is meant by the *co-ordination number* of a complex ion?

.....

.....

[1]

(b) The following equilibrium is readily established.

$$[Co(H_2O)_6]^{2+} + 4Cl^- \rightleftharpoons [CoCl_4]^{2-} + 6H_2O$$

(i) In the boxes below, draw the shape of each complex ion.

$[Co(H_2O)_6]^{2+}$		$[CoCl_4]^{2-}$

[2]

(ii) What colour change would you expect to see when an excess of Cl^- is added to $[Co(H_2O)_6]^{2+}$?

from ..... to .....

[2]

(iii) Describe how you would move the position of this equilibrium to the left.

.....

45. In this question, one mark is available for the quality of use and organisation of scientific terms.

Stereoisomerism is very common in transition metal complexes. Some complexes have found an important use in the treatment of cancer.

(i) Name a transition metal complex used in the treatment of cancer.

.....

[1]

(ii) Describe how this complex helps in the treatment of cancer.

.....

.....

.....

[2]

[Total 3 marks]

46. Describe the types of stereoisomerism found in transition metal complexes.

Use suitable examples to illustrate your answer.
