UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS
International General Certificate of Secondary Education

CHEMISTRY
Paper 2

Candidates answer on the Question Paper.
No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces at the top of this page.
Write in dark blue or black pen.
You may need to use a pencil for any diagrams, graphs or rough working.
Do not use staples, paper clips, highlighters, glue or correction fluid.
DO NOT WRITE IN ANY BARCODES.

Answer all questions.
A copy of the periodic table is printed on page 16.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

For Examiner's Use

<tr>
<td>C</td>
<td>a form of carbon which is black in colour and conducts electricity</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>white solid which is an insulator and has a high melting point</td>
<td></td>
</tr>
<tr>
<td>E</td>
<td>dull yellow solid which does not conduct heat</td>
<td></td>
</tr>
</tbody>
</table>

(b) Describe how metallic character changes across a Period.

(c) Sodium is in Group I of the Periodic Table.

(i) Draw a diagram to show the full electronic structure of sodium.

(ii) Complete the equation to show what happens when a sodium atom forms a sodium ion.

\[
\text{Na} \rightarrow \text{Na}^+ + \ldots
\]
(d) Complete these sentences about the properties of the Group I elements using words from the list.

acidic basic decrease hard
increase lithium potassium soft

The Group I elements are relatively ________________ metals which ________________ in reactivity going down the Group. Sodium reacts more violently with water than ________________.

The Group I metals all form ________________ oxides. [4]

[Total: 12]
2 (a) Match up the atmospheric pollutants on the left with their main source on the right.
The first one has been done for you.

- chlorofluorocarbons: car exhausts
- sulphur dioxide: aerosol sprays
- carbon monoxide: combustion of fossil fuels containing sulphur
- nitrogen oxides: incomplete combustion of fossil fuels

(b) One stage in the manufacture of sulphuric acid involves the oxidation of sulphur dioxide by oxygen in the air to form sulphur trioxide.

\[ 2\text{SO}_2 + \text{O}_2 \rightarrow 2\text{SO}_3 \]

(i) Explain how this reaction shows that sulphur dioxide is oxidized.

......................................................................................................................... [1]

(ii) What is the percentage of oxygen in clean air? .................................................. [1]

(iii) Sulphuric acid is used to make the fertiliser ammonium sulphate.

ammonia + sulphuric acid \(\rightarrow\) ammonium sulphate

What type of reaction is this?

......................................................................................................................... [1]
(iv) Why do farmers need to use fertilisers?

............................................................................................................................................ [2]

(v) Another fertiliser can be made by the reaction of ammonia with nitric acid. State the chemical name of this fertiliser.

............................................................................................................................................ [1]

[Total: 9]
3 Calcium carbonate, CaCO₃, is the raw material used in the manufacture of lime, CaO.

(a) (i) Describe how lime is manufactured from calcium carbonate.  

......................................................................................................................... [1]

(ii) Write a symbol equation for this reaction.  

......................................................................................................................... [1]

(iii) State one large scale use of lime.  

......................................................................................................................... [1]

(b) A student investigated the speed of reaction of calcium carbonate with hydrochloric acid using the apparatus shown below.

(i) Complete the labelling of the apparatus by filling in the three boxes.  

......................................................................................................................... [3]

(ii) The equation for the reaction is  

$$\text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{CO}_2 + \text{H}_2\text{O}$$

Write the word equation for this reaction.  

......................................................................................................................... [2]
(iii) The student carried out the reaction at 40°C using large pieces of calcium carbonate. The results of the experiment are shown below.

At what time did the reaction stop?  

(iv) The student repeated the experiment using the same mass of powdered calcium carbonate. All other conditions were kept the same. On the grid above, sketch the graph for the reaction with calcium carbonate powder.

(v) How does the speed of reaction change when  

the concentration of hydrochloric acid is decreased,  

the temperature is increased?  

[Total: 13]
Iron is extracted from its ore in a blast furnace.

(a) State the name of the ore from which iron is extracted.

(b) The diagram shows a blast furnace.

(i) Which one of the raw materials is added to the blast furnace to help remove the impurities from the iron ore?

(ii) The impurities are removed as a slag. Which letter on the diagram shows the slag?

(c) Carbon monoxide is formed in the blast furnace by reaction of coke with oxygen.

(i) Complete the equation for this reaction.

(ii) State the adverse affect of carbon monoxide on human health.
(d) In the hottest regions of the blast furnace the following reaction takes place.

\[ \text{Fe}_2\text{O}_3 + 3\text{C} \rightarrow 2\text{Fe} + 3\text{CO} \]

Which two of these sentences correctly describe this reaction? Tick two boxes.

- The iron oxide gets reduced. [ ]
- The reaction is a thermal decomposition. [ ]
- The carbon gets oxidised. [ ]
- The carbon gets reduced. [ ]
- Carbon neutralises the iron oxide. [ ]

(e) Aluminium cannot be extracted from aluminium oxide in a blast furnace.

Explain why aluminium cannot be extracted in this way.

...........................................................................................................................................................................

........................................................................................................................................................................... [2]

(f) (i) State the name of the method used to extract aluminium from its oxide ore.

........................................................................................................................................................................... [1]

(ii) State one use of aluminium.

........................................................................................................................................................................... [1]

[Total: 11]
5 The apparatus shown below can be used to measure the energy released when a liquid fuel is burnt. The amount of energy released is calculated from the increase in temperature of a known amount of water.

(a) (i) Explain how this experiment shows that the burning of ethanol is an exothermic reaction.  
.............................................................................................................................................................................. [1]

(ii) Complete the word equation for the complete combustion of ethanol.  
ethanol + oxygen → ................................................................................................................................. + ........................................................................ [2]

(b) Ethanol is a fuel containing carbon.  
State the names of two other commonly used fuels containing carbon.  
.............................................................................................................................................................................. and ........................................................................................................ [2]

(c) Give the formula of the functional group present in ethanol.  
.............................................................................................................................................................................. [1]

(d) The can contains water. Describe a chemical test for water.  

test ..............................................................................................................................................................................  
result .............................................................................................................................................................................. [2]
(e) The iron can used in this experiment rusts easily.

(i) Describe a method which can be used to prevent iron from rusting.

........................................................................................................................................ [1]

(ii) Rust contains hydrated iron(III) oxide.
    What do you understand by the term hydrated?

........................................................................................................................................ [1]

(iii) Iron is a transition metal.
    State two properties which are typical of transition metals.

........................................................................................................................................ [2]

[Total: 12]
6 The compound shown below is the first member of the alkane homologous series.

H
H—C—H
H

(a) State two characteristics of a homologous series.

..............................................................................................................................................
.............................................................................................................................................. [2]

(b) Name and draw the structure of the next member of the alkane homologous series.

name ...........................................................................................................................................

structure

(c) Complete the table to show the structure and uses of some organic compounds.

<table>
<thead>
<tr>
<th>name of compound</th>
<th>molecular formula</th>
<th>structure (showing all atoms and bonds)</th>
<th>use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ethene</td>
<td>C₂H₄</td>
<td></td>

</table>
|                  |                   | H                                       |           | [6]
(d) Calculate the relative molecular mass of dibromoethane.
7 The diagram shows the structures of calcium chloride, calcium and chlorine.

(a) Use ideas about structure and bonding to explain the following:

(i) Calcium chloride conducts electricity when molten but not when solid.

(ii) At room temperature, calcium is a solid but chlorine is a gas.
(b) Calcium is manufactured by the electrolysis of molten calcium chloride.

(i) State the products formed
at the anode, ............................................................................................................................................. [2]
at the cathode. ............................................................................................................................................... [2]

(ii) Suggest a non-metal that can be used as an anode in this electrolysis.
........................................................................................................................................................................ [1]

(iii) A stream of inert gas is blown over the calcium as it is removed from the molten calcium chloride.
Suggest why a stream of inert gas is blown over the hot calcium.
........................................................................................................................................................................ [1]

(iv) State the name of a gas which is inert.
........................................................................................................................................................................ [1]

(c) Aqueous sodium hydroxide or aqueous ammonia can be used to test for calcium ions in solution.
Describe the results of these tests
with aqueous sodium hydroxide, ........................................................................................................................ [2]
........................................................................................................................................................................ [2]
with aqueous ammonia. ........................................................................................................................................... [1]
........................................................................................................................................................................ [1]

[Total: 12]

#### Data Sheet

**Key**

- **a** = atomic symbol
- **b** = atomic number
- **X** = relative atomic mass

**Elements**

- **Li** to **Ar**: First 20 elements
- **K** to **Ba**: Next 32 elements
- **Fr**: Remainder

**Volume of one mole of any gas is 24 dm³ at room temperature and pressure (r.t.p.).**
