

# AQA Economics AS-level

## **Macroeconomics**

### Topic 3: Economic Performance

#### **3.2 Employment and unemployment**

Notes

## **Measures of unemployment**

It is usually difficult to accurately measure unemployment. Some of those in employment might claim unemployment related benefits, whilst some of the unemployed might not reveal this in a survey.

The two main measures of unemployment in the UK are:

### **The Claimant Count**

This counts the number of people claiming unemployment related benefits, such as Job Seeker's Allowance (JSA). They have to prove they are actively looking for work.

#### **Evaluating the Claimant Count:**

Not every unemployed person is eligible for, or bothers claiming JSA. Those with partners on high incomes will not be eligible for the benefit, even if they are unemployed. Although there may be instances of people claiming the benefit whilst they are employed, the method generally underestimated the level of unemployment.

### **The International Labour Organisation (ILO) and the UK Labour Force Survey (LFS)**

The LFS is taken on by the ILO. It directly asks people if they meet the following criteria:

- Been out of work for 4 weeks
- Able and willing to start working within 2 weeks
- Workers should be available for 1 hour per week. Part time unemployment is included.

Since the part time unemployed are less likely to claim unemployment benefit, this method gives a higher unemployment figure than the Claimant Count.

### **The significance of changes in the rates of:**

#### ○ **Employment and Unemployment:**

##### ▪ **Consumers**

If consumers are unemployed, they have less disposable income and their standard of living may fall as a result.

There are also psychological consequences of losing a job, which could affect the mental health of workers.

- **Firms**

With a higher rate of unemployment, firms have a larger supply of labour to employ from. This causes wages to fall, which would help firms reduce their costs.

However, with higher rates of unemployment, since consumers have less disposable income, consumer spending falls so firms may lose profits. Producers which sell inferior goods might see a rise in sales. It might cost firms to retrain workers, especially if they have been out of work for a long time.

- **Workers**

With unemployment, there is a waste of workers' resources. They could also lose their existing skills if they are not fully utilised.

- **The government**

If the unemployment rate increases, the government may have to spend more on JSA, which incurs an opportunity cost because the money could have been invested elsewhere.

The government would also receive less revenue from income tax, and from indirect taxes on expenditure, since the unemployed have less disposable income to spend.

- **Society**

There is an opportunity cost to society, since workers could have produced goods and services if they were employed.

There could be negative externalities in the form of crime and vandalism, if the unemployment rate increases.

- **Inactivity:** The economically inactive are those who are not actively looking for jobs. These could include carers for the elderly, disabled or children, or those who have retired. Some workers are discouraged from the labour market, since they have been out of work for so long that they have stopped looking for work. If the number of the economically inactive increases, the size of the labour force may decrease, which means the productive potential of the economy could fall.

## **The causes of unemployment:**

### **Structural unemployment**

This occurs with a long term decline in demand for the goods and services in an industry, which costs jobs. This is especially true of jobs in industries such as car manufacturing, where labour is replaced by capital (this is also called **technological unemployment**). Moreover, the decline of the coal and ship building industries in the UK, led to a great deal of structural unemployment.

This type of unemployment is worsened by the geographical and occupational immobility of labour. If workers do not have the transferable skills to move to another industry, or if it is not easy to move somewhere jobs are available, then those facing structural unemployment are likely to remain unemployed in the long run.

### **Frictional unemployment**

This is the time between leaving a job and looking for another job. It is common for there to always be some frictional unemployment, and it is not particularly damaging since it is only temporary.

For example, it could be the time between graduating from university and finding a job.

This is why it is rare to get 100% employment: there will always be people moving between jobs.

### **Seasonal unemployment**

This occurs during certain points in the year, usually around summer and winter. During the summer, more people will be employed in the tourist industry, when demand increases.

### **Demand deficiency (cyclical unemployment)**

This is caused by a lack of demand for goods and services, and it usually occurs during periods of economic decline or recessions. Firms are either forced to close or make workers redundant, because their profits are falling due to decreased consumer spending, and they need to reduce their costs. This then causes output to fall in several industries.

This type of unemployment could actually be caused by increases in productivity, which means each worker can produce a higher output, and therefore fewer workers are needed to produce the same quantity of goods and services.

### **How changes in the rest of the world affect employment and unemployment in the UK:**

-  Globalisation also contributes to structural unemployment, since production in the manufacturing sectors, such as in clothing or motor cars, moves abroad to countries with lower labour costs. This means that workers trained for these jobs will become unemployed, because the industry has declined in size or has been removed from the economy.
-  Migrants are usually of working age, so the supply of labour at all wage rates tends to increase with more migration. There could be more competition to get a job due to the rise in the size of the working population. Migrants tend to be of working age, and many are looking for a job. Migrants tend to bring high quality skills to the domestic workforce, which can increase productivity and increase the skillset of the labour market. This could increase global competitiveness.
