Pearson Edexcel IAL in Core Mathematics 34 (WMA02/01)

Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at www.edexcel.com or www.btec.co.uk. Alternatively, you can get in touch with us using the details on our contact us page at www.edexcel.com/contactus.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate’s response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate’s response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

PEARSON EDEXCEL IAL MATHEMATICS

General Instructions for Marking

1. The total number of marks for the paper is 125

2. The Edexcel Mathematics mark schemes use the following types of marks:

- **M** marks: Method marks are awarded for ‘knowing a method and attempting to apply it’, unless otherwise indicated.
- **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
- **B** marks are unconditional accuracy marks (independent of M marks)
- Marks should not be subdivided.

3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes.

- bod – benefit of doubt
- ft – follow through
- the symbol $\sqrt{}$ will be used for correct ft
- cao – correct answer only
- cso - correct solution only. There must be no errors in this part of the question to obtain this mark
- isw – ignore subsequent working
- awrt – answers which round to
- SC: special case
- oe – or equivalent (and appropriate)
- d… or dep – dependent
- indep – independent
- dp decimal places
- sf significant figures
- ∗ The answer is printed on the paper or ag- answer given
- or d… The second mark is dependent on gaining the first mark

4. All A marks are 'correct answer only' (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft.

5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected.

6. If a candidate makes more than one attempt at any question:
    - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
    - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.

7. Ignore wrong working or incorrect statements following a correct answer.

General Principles for Core Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles).

Method mark for solving 3 term quadratic:

1. Factorisation

$(x^2+bx+c)=(x+p)(x+q)$, where $|pq|=|c|$, leading to x = ...

$(ax^2+bx+c)=(mx+p)(nx+q)$, where $|pq|=|c|$ and $|mn|=|a|$, leading to x = ...

2. Formula

Attempt to use the correct formula (with values for a, b and c).

3. Completing the square

Solving $x^2+bx+c=0$: $\left(x\pm\frac{b}{2}\right)^2\pm q\pm c=0,\ \ q\neq 0$, leading to x = ...

Method marks for differentiation and integration:

1. Differentiation

Power of at least one term decreased by 1. ($x^n \to x^{n-1}$)

2. Integration

Power of at least one term increased by 1. ($x^n \to x^{n+1}$)

Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

Method mark for quoting a correct formula and attempting to use it, even if there are small errors in the substitution of values.

Where the formula is not quoted, the method mark can be gained by implication from correct working with values, but may be lost if there is any mistake in the working.

Exact answers

Examiners' reports have emphasised that where, for example, an exact answer is asked for, or working with surds is clearly required, marks will normally be lost if the candidate resorts to using rounded decimals.

Question Number	Scheme	Notes	Marks
1.(a)	$R = \sqrt{34}$	Cao (Must be exact but score when first seen and ignore decimal value (5.83…))	B1
	$\tan\alpha = \pm\frac{5}{3}, \tan\alpha = \pm\frac{3}{5} \Rightarrow \alpha = ...$ (Allow $\cos\alpha = \pm\frac{5}{\sqrt{34}}$ or $\pm\frac{3}{\sqrt{34}}, \sin\alpha = \pm\frac{5}{\sqrt{34}}$ or $\pm\frac{3}{\sqrt{34}} \Rightarrow \alpha = ...$) Where $\sqrt{34}$ is their R		M1
	$\alpha = 59.04°$	awrt 59.04°	A1
			(3)
(b)	$\sqrt{34}\cos(\theta - 59.04) = 2 \Rightarrow \cos(\theta - 59.04) = \frac{2}{\sqrt{34}}(0.343)$ Attempts to use part (a)$"\sqrt{34}"\cos(\theta - "59.04") = 2$ and proceeds to $\cos(\theta \pm "59.04") = K, \quad \lvert K\rvert \leqslant 1$ May be implied by $\theta - "59.04" = 69.94...^{o}$ or $\theta - "59.04"\cos^{-1}\left(\frac{2}{\text{their}\sqrt{34}}\right)$ The $\theta - "59.04"$ must be seen here or implied later		M1
	$\theta_1 - 59.04 = 69.94 \Rightarrow \theta_1 = \text{awrt } 129.0°$		A1
	$\theta_2 \pm 59.04 = 360 - '69.94' \Rightarrow \theta_2 = ...$ Correct attempt at a second solution in the range. It is **dependent** upon having scored the previous M. Usually for $\theta -$ their $59.04 = 360 -$ their $'69.94' \Rightarrow \theta = ...$		**d**M1
	$\theta_2 = 349.1°$	awrt 349.1°	A1
	For solutions in (b) that are otherwise fully correct, if there are extra answers in range, deduct the final A mark.		
			(4)
(c)	$\theta + \text{their } 59.04 = \cos^{-1}\left(\frac{2}{\text{their}\sqrt{34}}\right) \Rightarrow \theta = ...$ Allow $\theta - \text{their } 59.04 = \cos^{-1}\left(\frac{2}{\text{their}\sqrt{34}}\right) \Rightarrow \theta = ...$ if they have $\theta +$ .. in (b) Evidence that use is being made of parts (a) and (b) to obtain a value for θ. This can be implied by the use of their answers to part (b).		M1
	$\theta = 10.9^{o}$	awrt 10.9	A1
			(2)
			(9 marks)

Question Number	Scheme	Notes	Marks
2	$\frac{\mathrm{d}(4x\sin x)}{\mathrm{d}x} = 4x\cos x + 4\sin x$	Applies product rule to $4x\sin x$ to give $\frac{\mathrm{d}(4x\sin x)}{\mathrm{d}x} = \pm 4x\cos x + 4\sin x$	M1
	$\frac{\mathrm{d}(\pi y^2)}{\mathrm{d}y} = 2\pi y\frac{\mathrm{d}y}{\mathrm{d}x}$	Applies chain rule to πy^2 to give $\frac{\mathrm{d}(\pi y^2)}{\mathrm{d}y} = Ay\frac{\mathrm{d}y}{\mathrm{d}x}$	M1
	$4x\sin x = \pi y^2 + 2x \Rightarrow 4x\cos x + 4\sin x = 2\pi y\frac{\mathrm{d}y}{\mathrm{d}x} + 2$ Fully correct differentiation. oe Accept $4x\cos x\mathrm{d}x + 4\sin x\mathrm{d}x = 2\pi y\mathrm{d}y + 2\mathrm{d}x$		A1
	For the differentiation ignore any spurious $"\frac{\mathrm{d}y}{\mathrm{d}x} ="$		
	Alternative for first 3 marks using explicit differentiation: $y = \left(\frac{1}{\sqrt{\pi}}\right)(4x\sin x - 2x)^{\frac{1}{2}}$		
	$\frac{\mathrm{d}y}{\mathrm{d}x} = \left(\frac{1}{2\sqrt{\pi}}\right)(4x\sin x - 2x)^{-\frac{1}{2}}(4x\cos x + 4\sin x - 2)$ M1: $\frac{\mathrm{d}(4x\sin x)}{\mathrm{d}x} = \pm 4x\cos x + 4\sin x$ (as before) M1: $(4x\sin x - 2x)^{\frac{1}{2}} \to k(4x\sin x - 2x)^{-\frac{1}{2}}$		M1 M1
	Allow omission of π and sign errors when rearranging for the M marks		
	$\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{1}{2\sqrt{\pi}}(4x\sin x - 2x)^{-\frac{1}{2}}(4x\cos x + 4\sin x - 2)$ oe		A1
	$x = \frac{\pi}{2}, y = 1$ $\Rightarrow 4 = 2\pi\frac{\mathrm{d}y}{\mathrm{d}x} + 2 \Rightarrow \frac{\mathrm{d}y}{\mathrm{d}x} = \ldots\left(\frac{1}{\pi}\right)$	Uses $x = \frac{\pi}{2}$ and $y = 1$ to obtain a value for $\frac{\mathrm{d}y}{\mathrm{d}x}$ (may be implied). For implicit differentiation, there must be a d*y*/d*x* and there must be *x*'s and *y*'s. Explicit differentiation just requires use of $x = \frac{\pi}{2}$.	M1
	$y - 1 = "-\pi"\left(x - \frac{\pi}{2}\right)$ or $y = "-\pi"x + c \Rightarrow c = 1 + \frac{\pi^2}{2}$ Uses normal gradient $-1\Big/\frac{\mathrm{d}y}{\mathrm{d}x}$ and $x = \frac{\pi}{2}, y = 1$ to find equation of normal. Must use $-1\Big/\left(\text{their } \frac{\mathrm{d}y}{\mathrm{d}x}\right)$ and $x = \frac{\pi}{2}$ and $y = 1$ must be correctly placed. If using $y = mx + c$ must reach as far as $c = \ldots$		M1
	$y - 1 = -\pi\left(x - \frac{\pi}{2}\right)$ oe	Allow 3sf or more decimal equivalent answers e.g. $y = -3.14x + 5.93$, $y - 1 = -3.14(x - 1.57)$ etc.	A1cso
			(6 marks)

Question Number	Scheme	Notes	Marks
3(a)	$(1+ax)^{-3}=1+(-3)(ax)+\frac{(-3)(-4)}{2!}(ax)^2+\frac{(-3)(-4)(-5)}{3!}(ax)^3+...$ Uses the binomial expansion with $n=-3$ and $'x'=ax$. Minimum for M1 is $1+(-3)(ax)$ but can be scored for a correct 3rd or 4th term e.g. $\frac{(-3)(-4)}{2!}(ax)^2$ or $\frac{(-3)(-4)(-5)}{3!}(ax)^3$		M1
	$=1-3ax+6a^2x^2-10a^3x^3+...$ or $=1-3ax+6(ax)^2-10(ax)^3+...$	A1: Three of the four terms correct and simplified A1: All four terms correct and simplified and seen in part (a).	A1A1
			(3)
(b)	$f(x)=\frac{2+3x}{(1+ax)^3}=(2+3x)(1-3ax+6a^2x^2-10a^3x^3)$ Writes $f(x)$ as $(2+3x)(1-3ax+6a^2x^2-10a^3x^3)$ using their expansion from part (a). This may be implied by their expansion. Do not condone 'invisible' brackets around 2 + 3x or part(a) unless their presence is implied by later work and allow to recover in (b) from missing brackets in (a) e.g. ax^2 now becoming a^2x^2		M1
	NB $f(x)=2+(3-6a)x+(12a^2-9a)x^2+(18a^2-20a^3)x^3$		
	$12a^2-9a=3$	Multiplies out and sets their coefficient of x^2 (which comes from exactly 2 terms from their expansion – the two terms may have been combined earlier) = 3.	dM1
	$4a^2-3a-1=(4a+1)(a-1)\Rightarrow a=...$ Correct method of solving a 3TQ. If working is shown see general guidance for correct methods. If no working is shown then you may need to check their values if their quadratic is incorrect.		ddM1
	$a=-\frac{1}{4}$	Cao. Accept equivalent answers but must come from the **correct quadratic** and must be clearly identified.	A1
			(4)
(c)	$18\left(-\frac{1}{4}\right)^2-20\left(-\frac{1}{4}\right)^3$	Subs their $a=-\frac{1}{4}$ (positive or negative) into their coefficient of x^3 (which comes from exactly 2 terms from their expansion)	M1
	Coefficient of x^3 is $\frac{23}{16}$	Cao. Allow $\frac{23}{16}x^3$	A1

(b)	$g'(x) = 2x - \frac{3}{(x-3)^2}$	M1: $x^2 + A + \frac{B}{x-3} \to 2x \pm \frac{B}{(x-3)^2}$ A1: $x^2 + A + \frac{B}{x-3} \to 2x - \frac{B}{(x-3)^2}$ Follow through their B or the letter B or a made up B.	M1A1ft
	Special Case: If they write g(x) as $x^2 + 5 + \frac{3x+12}{(x-3)}$ and correctly attempt to differentiate as $2x$ + the quotient rule on $\frac{3x+12}{(x-3)}$ then the M mark is available but **not** the A1ft. It must be the correct quotient rule and the numerator must be a linear expression.		
	$g'(4) = 2\times 4 - \frac{3}{(4-3)^2} (=5)$	Substitutes $x = 4$ into their derivative	M1
	Uses $m = g'(4) = (5)$ with $(4, g(4)) = (4, 24)$ to form eqn of tangent		
	$y - 24 = 5(x-4)$	Correct method of finding an equation of the tangent. The gradient must be $g'(4)$ and the point must be an attempt on $(4, g(4))$	M1
	$y = 5x + 4$	Cso. This mark may be withheld for an incorrect "A" earlier or any incorrect work leading to a correct gradient.	A1

	Volume = $48\pi\left[\frac{u^3}{3} - \frac{u^5}{5}\right]_0^{\frac{1}{2}} = \frac{17\pi}{10}$	**d**M1: All methods must have been scored. It is for using the limits 0 and $\frac{1}{2}$ and subtracting or for using the limits 0 and $\frac{\pi}{6}$ if they return to sin t. However, in both cases the substitution of 0 does not need not be seen. A1: $V = \frac{17\pi}{10}$ oe such as $V = \frac{51\pi}{30}$	**d**M1A1

13(a)	$V=\frac{1}{3}\pi h^2(30-h)=10\pi h^2-\frac{1}{3}\pi h^3\Rightarrow\frac{\mathrm{d}V}{\mathrm{d}h}=20\pi h-\pi h^2$ or $V=\frac{1}{3}\pi h^2(30-h)\Rightarrow\frac{\mathrm{d}V}{\mathrm{d}h}=\frac{2}{3}\pi h(30-h)-\frac{1}{3}\pi h^2$		M1A1
	M1: Attempts $\frac{\mathrm{d}V}{\mathrm{d}h}$ either by multiplying out and differentiating each term to give a derivative of the form $\alpha h-\beta h^2$ or by the product rule to give a derivative of the form $\alpha h(30-h)\pm\beta h^2$. **A1:** Any correct (possibly un-simplified) form for $\frac{\mathrm{d}V}{\mathrm{d}h}$		
	Uses $\frac{\mathrm{d}V}{\mathrm{d}t}=\frac{\mathrm{d}V}{\mathrm{d}h}\times\frac{\mathrm{d}h}{\mathrm{d}t}\Rightarrow-\frac{1}{10}V=\left(20\pi h-\pi h^2\right)\times\frac{\mathrm{d}h}{\mathrm{d}t}$		M1
	Uses a **correct** form of the chain rule, e.g. $\frac{\mathrm{d}V}{\mathrm{d}t}=\frac{\mathrm{d}V}{\mathrm{d}h}\times\frac{\mathrm{d}h}{\mathrm{d}t}$ or uses $\frac{\mathrm{d}h}{\mathrm{d}V}\times\frac{\mathrm{d}V}{\mathrm{d}t}$ with their $\frac{\mathrm{d}V}{\mathrm{d}h}$ and $\frac{\mathrm{d}V}{\mathrm{d}t}=-\frac{1}{10}V$.		
	$\Rightarrow-\frac{1}{10}\times\frac{1}{3}\pi h^2(30-h)=\pi h(20-h)\times\frac{\mathrm{d}h}{\mathrm{d}t}\left(\Rightarrow\frac{\mathrm{d}h}{\mathrm{d}t}=...\right)$		M1
	Substitutes $V=\frac{1}{3}\pi h^2(30-h)$ and rearranges to obtain $\frac{\mathrm{d}h}{\mathrm{d}t}$ in terms of h		
	$\frac{\mathrm{d}h}{\mathrm{d}t}=-\frac{h(30-h)}{30(20-h)}$ *	This is a given answer. There must have been intermediate lines and correct factorisation and no errors and "$\frac{\mathrm{d}h}{\mathrm{d}t}=$"must be seen at some point.	A1*

(b)	$\frac{30(20-h)}{h(30-h)}\equiv\frac{A}{h}+\frac{B}{30-h}$	Correct form for the partial fractions	B1
	$30(20-h)\equiv A(30-h)+Bh$ $h=30\Rightarrow30B=-300\Rightarrow B=-10$ and $h=0\Rightarrow30A=600\Rightarrow A=20$ Attempts to get both constants by a correct method e.g. substituting, comparing coefficients, cover up rule		M1
	$\frac{30(20-h)}{h(30-h)}\equiv\frac{20}{h}-\frac{10}{30-h}$	Correct partial fractions (or states "A" = 20, "B" = -10)	A1

	$\frac{\mathrm{d}h}{\mathrm{d}t} = -\frac{h(30-h)}{30(20-h)} \Rightarrow \int \frac{30(20-h)}{h(30-h)}\mathrm{d}h = -1\int \mathrm{d}t$ A correct statement which may be implied by subsequent work. Condone the omission of "d*h*" and "d*t*" provided the intention is clear but the minus sign must be present on one side or the other.		B1
	$20\ln h + 10\ln(30-h)$	M1: Integrates their partial fractions to obtain $\pm P\ln h \pm Q\ln(30-h)$ A1: Correct integration for their partial fractions of the form $\frac{A}{h}+\frac{B}{30-h}$ following through their "*A*" and "*B*".	M1A1ft
	$t=0, h=10 \Rightarrow c = 20\ln 10 + 10\ln 20$	Substitutes *h* = 10 and *t* = 0 to find a value for *c*. NB *c* = 76.0…	M1
	$h=5 \Rightarrow t = 20\ln 10 + 10\ln 20 - 10\ln 25 - 20\ln 5$ Substitutes *h* = 5 and uses their value of *c* to find a value for *t*.		ddM1
