

GCSE Maths – Number

Systematic Listing

Worksheet

WORKED SOLUTIONS

This worksheet will show you how to work out different types of questions on systematic listing. Each section contains a worked example, a question with hints and then questions for you to work through on your own.

Section A

Worked Example

A cafe is selling drinks and snacks. Today the drinks they are selling are tea, coffee and orange juice. The snacks are apples, cake and crisps. How many possible combinations are there of one drink and one snack ?

Step 1: Create a table.

	Apples	Cakes	Crisps
Tea			
Coffee			
Orange juice			

Step 2: Read again, what is required in the question and mark the possible combinations/ outcomes.

*This question asks possible combinations of **1 drink and 1 snack**.*

Therefore, each drink will go with each of the snacks once.

The following diagram shows the equivalent of the following combinations.

- Tea and an apple
- Tea and cake
- Tea and crisps
- Coffee and an apple
- Coffee and cake
- Coffee and crisps
- Orange juice and an apple
- Orange juice and cake
- Orange juice and crisps

	Apples	Cakes	Crisps
Tea	✓	✓	✓
Coffee	✓	✓	✓
Orange juice	✓	✓	✓

Counting the number of ticks: 9 possible combinations

Guided Example

There are two groups of colours. First group has the colours blue and red. Second group has the colours green, purple, black and white. How many possible combinations are there of a colour from group 1 and a colour from group 2?

Step 1: Create a table

		Group 2			
		Green	Purple	Black	White
Group 1	Blue	✓	✓	✓	✓
	Red	✓	✓	✓	✓

Step 2: Read again, what is required in the question and mark the possible combinations/ outcomes.

Blue and Green
Blue and Purple
Blue and Black
Blue and white

Red and Green
Red and Purple
Red and Black
Red and white

There are 8 combinations

Now it's your turn!

If you get stuck, look back at the worked and guided examples.

1. A school plays different sports: cricket, football, basketball, table tennis, volleyball. How many possible combinations can be made from 1 person and 1 sport?

1 person can play 1 sport.

There are 5 different sports:

Cricket, football, basketball, table tennis, volleyball.

Therefore there are 5 possible combinations.

2. A person must take two subjects. They must choose one subject from Geography and History and one subject from Arts, Drama and German. List the possible combinations.

		Choice 1	
		Geog	Hist
Choice 2	Art	✓	✓
	Drama	✓	✓
German	✓	✓	

Combinations:

Geography and Art
 Geography and Drama
 Geography and German
 History and Art
 History and Drama
 History and German

3. You roll a six sided dice and flip a coin at the same time. List all possible outcomes.

		Coin Flip	
		Head	Tail
Dice	1	✓	✓
	2	✓	✓
	3	✓	✓
	4	✓	✓
	5	✓	✓
	6	✓	✓

All Outcomes

Head and 1 Tail and 1
 Head and 2 Tail and 2
 Head and 3 Tail and 3
 Head and 4 Tail and 4
 Head and 5 Tail and 5
 Head and 6 Tail and 6

Section B – Higher only

Worked Example 1

At a restaurant there are 6 possible starters, 5 mains and 4 desserts on offer. Using the product rule, calculate how many possible combinations of starter, main course and dessert there are.

Step 1: Using the product rule, multiply the number of items from each group together.

We multiply the 'number of starters' x 'number of mains' x 'number of desserts':

$$6 \times 5 \times 4 = 120$$

Therefore, there are 120 possible combinations.

Guided Example 1

A person is grouping numbers and letters. There are 15 letters and the numbers are from 1 to 10. How many possible combinations can be made from 1 letter and 1 number?

Step 1: Using the product rule, multiply the number of items from each group together.

$$\begin{array}{r} \text{Number of letters} \times \text{Number of Numbers} \\ 15 \quad \times \quad 10 \\ = 150 \end{array}$$

Therefore, there are 150 combinations.

Worked Example 2

Work out the total number of ways 1, 2, 3, 4 and 5 can be ordered.

Step 1: Find the total options present for each item/number.

Starting from 1, it will have 5 options.

2 will have 4 options because a place is already used by 1.

By the same logic, 3 will have 3 options, 4 will have 2 options and 5 will have 1 option.

Step 2: Use the product rule with the possible options.

The total number of ways:

$$5 \times 4 \times 3 \times 2 \times 1 = 120$$

Guided Example 2

There are 4 people in a room and 4 chairs. Find the total number of different ways everyone can sit on the chairs.

Step 1: Find the total options present for each item/number.

The first person will have 4 options of chairs
The second person will have 3 options of chairs
The third person will have 2 options of chairs
The fourth person will have 1 option of chairs

Step 2: Use the product rule with the possible options.

$$4 \times 3 \times 2 \times 1 = 24$$

There are 24 options.

Now it's your turn!

If you get stuck, look back at the worked and guided examples.

4. There are a group of boys and a group of girls auditioning to play Romeo and Juliet. There are 20 boys and 17 girls. Work out the total number of pairs that can be made for the role of Romeo and Juliet.

$$\begin{array}{rcl}
 \text{Number of boys} & \times & \text{Number of girls} \\
 \text{(to play Romeo)} & & \text{(to play Juliet)} \\
 20 & \times & 17 \\
 = & & 340 \text{ possible pairs}
 \end{array}$$

5. A bike has a two digit lock. The digits range from 1 to 9 including 1 and 9. How many possible combinations can be made in the lock?

$$\begin{array}{rcl}
 1^{\text{st}} \text{ Digit} & \times & 2^{\text{nd}} \text{ Digit} \\
 9 \text{ numbers} & \times & 9 \text{ numbers} \\
 = & & 81 \text{ possible combinations}
 \end{array}$$

6. How many possible ways of ordering the numbers 1, 5, 6, 7, 5?

The first place will have 5 options

The second place will have 4 options

The third place will have 3 options

The fourth place will have 2 options

The fifth place will have 1 option

$$5 \times 4 \times 3 \times 2 \times 1 = 120 \quad \therefore 120 \text{ possible ways}$$

7. A three-digit lock has numbers 3 to 8 including 3 and 8. How many possible combinations can be made without repeating a number?

The first digit will have 6 options

The second digit will have 5 options

The third digit will have 4 options

$$6 \times 5 \times 4 = 120$$

120 combinations, without repeating.
